Introduction and Scope

The Surf SOHO is a professional-grade router that is secure, reliable, and easy to use.

With the Surf SOHO, you can connect to the Internet using a USB cellular modem, Ethernet, or Wi-Fi. Hook the Surf SOHO up to Ethernet and Cellular connections, and it will automatically fail over from one to the other as needed. That way, you can stay connected even when a connection breaks

This manual covers setting up a Surf SOHO router and provides an introduction to their features and usage.

Tips

Want to know more about Pepwave routers? Visit our [YouTube Channel](#) for a [video introduction](#).

Glossary

The following terms, acronyms, and abbreviations are frequently used in this manual:

Term	Definition
3G	3rd generation standards for wireless communications (e.g., HSDPA)
4G	4th generation standards for wireless communications (e.g., LTE)
DHCP	Dynamic Host Configuration Protocol
DNS	Domain Name System
EVDO	Evolution-Data Optimized
FQDN	Fully Qualified Domain Name
HSDPA	High-Speed Downlink Packet Access
HTTP	Hyper-Text Transfer Protocol
ICMP	Internet Control Message Protocol
IP	Internet Protocol
LAN	Local Area Network
MAC Address	Media Access Control Address
MTU	Maximum Transmission Unit
MSS	Maximum Segment Size
NAT	Network Address Translation
PPPoE	Point to Point Protocol over Ethernet
QoS	Quality of Service
SNMP	Simple Network Management Protocol
TCP	Transmission Control Protocol
UDP	User Datagram Protocol
VPN	Virtual Private Network
VRRP	Virtual Router Redundancy Protocol
WAN	Wide Area Network
WINS	Windows Internet Name Service
WLAN	Wireless Local Area Network

Product Features

PepwaveSurf SOHO routers enable all LAN users to share broadband Internet connections, and they provide advanced features to enhance Internet access. Our Surf SOHO routers support one Ethernet, one USB 4G LTE/3G WAN, and Wi-Fi as WAN for failover

It also includes three SMA dual-band antennas that allows better reliability, larger bandwidth, and increased wireless coverage.

Below is a list of supported features on Pepwave routers. Features vary by model.

For more information, please visit [our website](#).

WAN

- Ethernet WAN connection in full/half duplex
- Static IP support for PPPoE
- USB mobile connection(s)
- Wi-Fi WAN connection
- Network address translation (NAT)/port address translation (PAT)
- Inbound and outbound NAT mapping
- IPsec NAT-T and PPTP packet pass through
- Intelligent Failover
- MAC address clone and passthrough
- Customizable MTU and MSS values
- WAN connection health check
- Dynamic DNS
- Ping, DNS lookup, and HTTP-based health check

LAN

- Wi-Fi AP
- Ethernet LAN ports
- DHCP server on LAN
- Extended DHCP option support
- Static routing rules
- VLAN on LAN support

VPN

- Site-to-Site VPN
- 256-bit AES Encryption
- Dynamic Routing
- Pre-shared key authentication
- PPTP/L2TP/Open VPN - VPN server

Firewall

- Outbound (LAN to WAN) firewall rules
- Inbound (WAN to LAN) firewall rules per WAN connection
- Intrusion detection and prevention
- Specification of NAT mappings
- Outbound firewall rules can be defined by destination domain name

Outbound Policy

- Link load distribution per TCP/UDP service
- Persistent routing for specified source and/or destination IP addresses per TCP/UDP service
- Traffic prioritization and DSL optimization
- Prioritize and route traffic to VPN tunnels with Priority and Enforced algorithms

QoS

- Quality of service for different applications and custom protocols
- User group classification for different service levels
- Bandwidth usage control and monitoring on group- and user-level
- Application prioritization for custom protocols and DSL/cable optimization

Other Supported Features

- User-friendly web-based administration interface
- HTTP and HTTPS support for web admin interface
- Configurable web administration port and administrator password
- Firmware upgrades, configuration backups, ping, and traceroute via web admin interface
- Remote web-based configuration (via WAN and LAN interfaces)
- Time server synchronization
- SNMP
- Email notification
- Read-only user for web admin
- Shared IP drop-in mode
- Authentication and accounting by RADIUS server for web admin
- Syslog
- SIP passthrough
- PPTP packet pass through
- Event log
- Active sessions
- Client list
- UPnP / NAT-PMP
- Real-time, hourly, daily, and monthly bandwidth usage reports and charts

Pepwave Surf SOHO Router Overview

Panel Appearance

Specifications	
WAN Interface	1x 100/1000M Ethernet Port 1x USB 2.0 Interface Wi-Fi as WAN
LAN Interface	4x 100/1000M Ethernet Ports Simultaneous Dual-Band 11ac Wi-Fi AP
Wi-Fi AP Operating Frequency	2412 – 2472 MHz and 5180 - 5825 MHz
Wi-Fi Antenna	3x External Wi-Fi Antenna
Recommended Users	1-25
Router Throughput	120Mbps
Number of PPTP VPN Users	3
Number of PPTP VPN Users	2
Power Input	DC Jack: 10V – 24VDC AC Adapter: AC Input 100V – 240V, DC Output 12V, 1.5A
Power Consumption	26W (max) with USB WAN 22W (max) without USB WAN
Dimensions	9.17 x 5.6 x 1.18 inch 233 x 142 x 30 mm
Weight	0.86 pounds 388 grams
Operating Temperature	-14° to 113°F -10° to 45°C
Humidity	15% – 95% (non-condensing)
Certifications	FCC, CE, RoHS
Warranty	1-Year Limited Warranty

LED Indicators

The statuses indicated by the front panel LEDs are as follows:

Wi-Fi and Status Indicators		
Wi-Fi	OFF	Disabled Intermittent
	Blinking	Enabled but no client connected
	ON	Client(s) connected to wireless network
	Continuous blinking	Transferring data to wireless network
Status	OFF	System initializing
	Red	Booting up or busy
	Green	Ready state

LAN and Ethernet WAN Ports		
Green LED	ON	1000 Mbps
	OFF	10 Mbps / 100 Mbps or port is not connected
	ON	Port is being connected
Orange LED	Blinking	Data is being transferred
	OFF	No data is being transferred or port is not connected
Port type	Auto MDI/MDI-X ports	

Wi-Fi Signal	
Off	No connection
Signal strength	Wi-Fi signal strength (low, medium, and high)

Advanced Feature Summary

Drop-in Mode and LAN Bypass: Transparent Deployment

As your organization grows, it may require more bandwidth, but modifying your network can be tedious. In **Drop-in Mode**, you can conveniently install your Peplink router without making any changes to your network. For any reason your Peplink router loses power, the **LAN Bypass** will safely and automatically bypass the Peplink router to resume your original network connection.

QoS: Clearer VoIP

VoIP and videoconferencing are highly sensitive to latency. With QoS, Peplink routers can detect VoIP traffic and assign it the highest priority, giving you crystal-clear calls.

USB Modem

For increased WAN diversity, plug in a USB LTE modem as a backup. Peplink routers are compatible with over [250 modem types](#).

Built-In Remote User VPN Support

Use OpenVPN or L2TP with IPsec to safely and conveniently connect remote clients to your private network. L2TP with IPsec is supported by most devices, but legacy devices can also connect using PPTP.

[Click here for the full instructions on setting up L2TP with IPsec.](#)

[Click here for the full instructions on setting up OpenVPN connections](#)

DPI Engine

The DPI report written in the updated KB article will show further information on InControl2 through breaking down application categories into subcategories.

sscs

<https://forum.peplink.com/t/updated-ic2-deep-packet-inspection-dpi-reports-and-everything-you-need-to-know-about-it/29658>

Wi-Fi Air Monitoring

Pepwave routers support Wi-Fi “Air Monitoring Mode” which used to troubleshoot remotely and proactively monitor Wi-Fi and WAN performance. The report can be viewed under InControl 2 > Reports > AirProbe Reports after enabling Wi-Fi Air Monitoring.

Note: To enable this feature, go to <https://<Device's IP>/cgi-bin/MANGA/support.cgi>

- **Wi-Fi Air Monitoring**
 Enable
WARNING: Any supported Wi-Fi / AP features will cease to function when Wi-Fi Air Monitoring is turned on.

SP Default Configuration

The SP Default Configuration feature written in the updated KB article allows for the provisioning of custom made settings (a.k.a. InControl2 configuration) via the Ethernet LAN port and is ideal for those wanting to do a bulk deployment of many Peplink devices.

Note: If you would like to use this feature, please contact your purchase point (Eg.VAD).

Installation

The following section details connecting Pepwave routers to your network.

Preparation

Before installing your Pepwave router, please prepare the following as appropriate for your installation:

- At least one Internet/WAN access account and/or Wi-Fi access information
 - Depending on network connection type(s), one or more of the following:
 - **Ethernet WAN:** An ethernet cable with RJ45 connector
 - **USB:** A USB modem
 - **Wi-Fi WAN:** Wi-Fi antennas
- A computer with the TCP/IP network protocol and a web browser installed. Supported browsers include Microsoft Internet Explorer 11 or above, Mozilla Firefox 24 or above, Apple Safari 7 or above, and Google Chrome 18 or above.

Constructing the Network

Construct the network according to the following steps:

1: With an Ethernet cable, connect a computer to one of the LAN ports on the Pepwave router. Repeat with different cables for up to 4 computers to be connected.

2: With another Ethernet cable or a USB modem/Wi-Fi antenna/, connect to one of the WAN ports on the Pepwave router. Repeat the same procedure for other WAN ports.

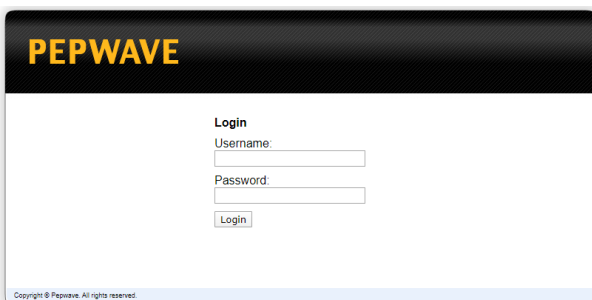

Connect the power adapter to the power connector on the rear panel of the Pepwave router, and then plug it into a power outlet.

Connecting to the Web Admin Interface

Start a web browser on a computer that is connected with the Pepwave Surf SOHO through the LAN.

To connect to the web admin of the Pepwave Surf SOHO, enter the following LAN IP address in the address field of the web browser: **https://192.168.50.1**

(This is the default LAN IP address of the Pepwave Surf SOHO.) Enter the following to access the web admin interface.

Username: admin

Password: admin

(This is the default admin user login of the Pepwave Surf SOHO.)

You must change the default password on the first successful logon.

Password requirements are: A minimum of 10 lower AND upper case characters, including at least 1 number.

When HTTP is selected, the URL will be redirected to HTTPS by default.

The **Dashboard** shows current WAN, LAN, and Wi-Fi AP statuses. Here, you can change WAN connection priority and

switch on/off the Wi-Fi AP.

Device Information displays details about the device, including model name, firmware version, CPU Load, throughput and uptime.

Important Note

Configuration changes (e.g. WAN, LAN, admin settings, etc.) will take effect only after clicking the **Save** button at the bottom of each page. The **Apply Changes** button causes the changes to be saved and applied.

SpeedFusion Cloud

With Peplink products, your device is able to connect to SpeedFusion Cloud without the use of a second endpoint. This service has wide access to a number of SpeedFusion endpoints hosted from around the world, providing your device with unbreakable connectivity wherever you are.*

*SpeedFusion Cloud is supported in firmware version 8.1.0 and above. SpeedFusion Cloud is a subscription basis. SpeedFusion Cloud license can be purchased at <https://store.peplink.com/> > **Cloud Solutions** > **SpeedFusion Cloud Service**.

Activate SpeedFusion Cloud Service

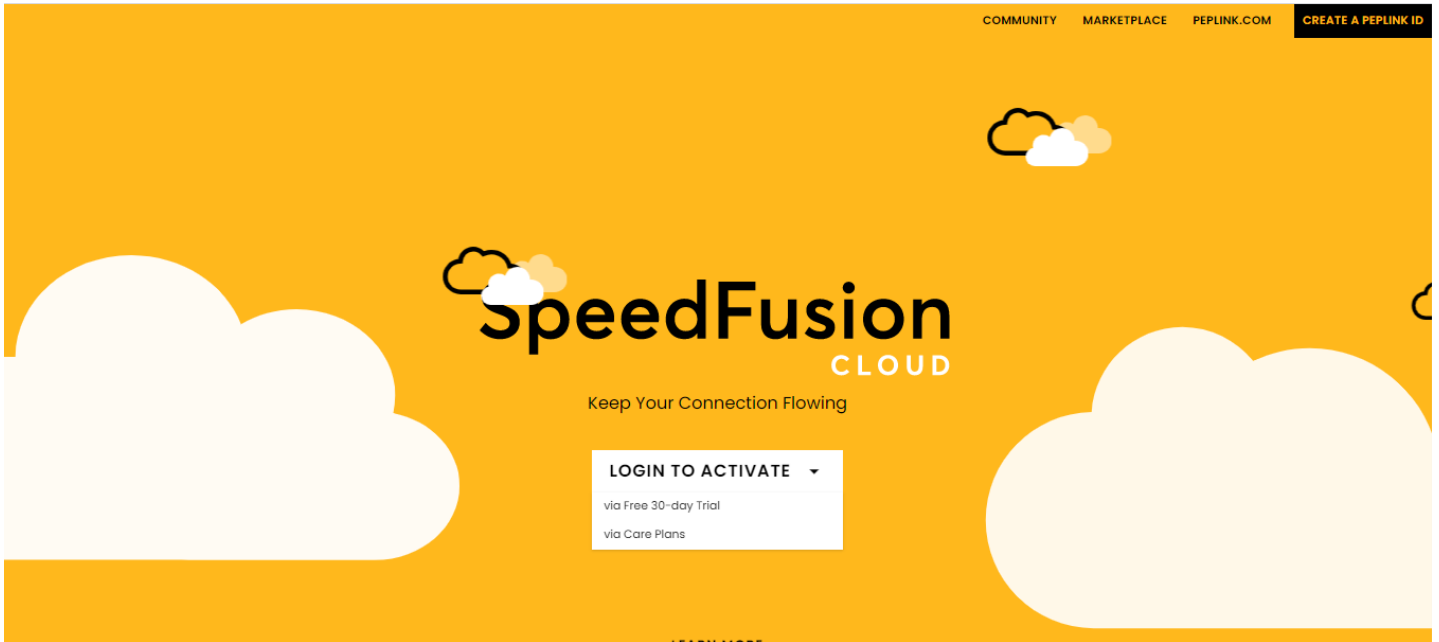

You are entitled to a 30-days free period with 100GB of SpeedFusion usage upon activation of the SpeedFusion Cloud service. This offer is limited to once per device. To get your activation key please visit SpeedFusion Cloud.

The screenshot shows the Peplink web interface for SpeedFusion Cloud. The navigation bar includes 'Dashboard', 'Setup Wizard', 'SpeedFusion Cloud' (highlighted), 'Network', 'AP', 'System', 'Status', and 'Apply Changes'. The main content area is titled 'SpeedFusion Cloud' and includes the subtext 'Aggregate your bandwidth, connect you to different geo-location, and more.' Below this are four main action items:

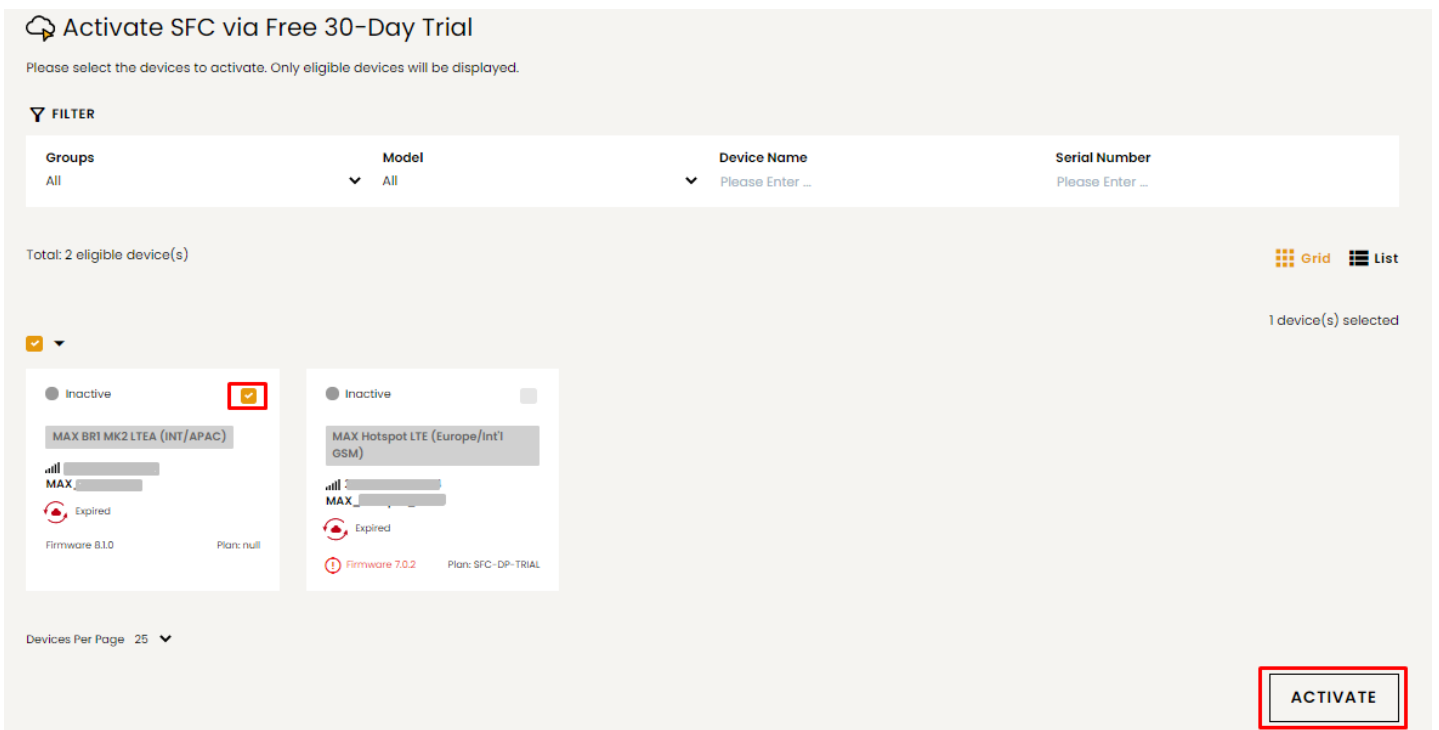

- Get your activation key now**: Enjoy all the delicious features powered by SpeedFusion. (This button is highlighted with a red box in the original image.)
- Choose Cloud Location**: Which cloud you'd like to connect?
- Connect Clients to Cloud**: Select a cloud for your laptops, phones, or other devices.
- Link Wi-Fi to Cloud**: Create a Wi-Fi SSID that is dedicated for the cloud.

A 'Logout' button is visible in the bottom left corner of the dashboard area.

Go to activate.speedfusion.com and select the type of SpeedFusion Cloud service, “Via Free 30-days Trial” or “Via Care Plans”, that you would like to activate. Next, register or login to your account.

Select the devices that you wish to activate SpeedFusion Cloud on and Click **ACTIVATE**.

From **System > Features Add-ons**, paste the license key into the window and click on **Activate** once you have received the license key.

The screenshot shows the PEPWAVE web interface. The top navigation bar includes: Dashboard, SpeedFusion Cloud, Network, Advanced, AP, System (selected), Status, and Apply Changes. The left sidebar lists System and Tools categories. Under System, 'Feature Add-ons' is selected. The main content area displays the 'Feature Activation' window with the following details:

Feature Activation	
Activation Key	9629a523e54fe148f876e75cf95df776f248e248b618b618a6199b23e54fe148f876e75cf95df776f351e640e450b618b618a310ae10a711a219a6249c5af05ef747c958e346e248c95bf75df309a709a3199c7ae64cf34dd05ce540f947b66afa46e34db668f55dff5ff75dff46f809dd4cef09be18a619d16bbfa96c3083b48a7d337ade187a5ce2e4e1

Below the activation key is an **Activate** button.

Enable SpeedFusion Cloud

Enable SpeedFusion Cloud from **SpeedFusion Cloud > Choose Cloud Location**.

The screenshot shows the PEPWAVE web interface for SpeedFusion Cloud. The top navigation bar includes: Dashboard, SpeedFusion Cloud (selected), Network, AP, System, Status, and Apply Changes. The main content area displays the 'SpeedFusion Cloud' section with the following details:

SpeedFusion Cloud
Aggregate your bandwidth, connect you to different geo-location, and more.

- Choose Cloud Location**
Which cloud you'd like to connect?
- Connect Clients to Cloud**
Select a cloud for your laptops, phones, or other devices.

Choose **Automatic** > Click on the **green tick button** to confirm the change.

Below the table is a 'Save' button.

SpeedFusion Cloud SSID will be shown on **Dashboard**.

The screenshot shows the 'LAN Interface' section with the Router IP Address: 192.168.54.1. Below it is the 'Wi-Fi AP' section, which is turned ON. The Wi-Fi APs listed are 'HomeBunker', 'Home', and 'Home_SFC'. The 'Home_SFC' SSID is highlighted with a red box.

Optimize Cloud Application

Optimize Cloud Application allows you to route Internet traffic to SpeedFusion Cloud based on the application. Go to **SpeedFusion Cloud > Optimize Cloud Application**.

PEPWAVE Dashboard **SpeedFusion Cloud** Network Advanced AP System Status Apply Changes

SpeedFusion Cloud

Aggregate your bandwidth, connect you to different geo-location, and more.

- Get your activation key now**
Enjoy all the delicious features powered by SpeedFusion.
- Choose Cloud Location**
Which cloud you'd like to connect?
- Connect Clients to Cloud**
Select a cloud for your laptops, phones, or other devices.
- Link Wi-Fi to Cloud**
Create a Wi-Fi SSID that is dedicated for the cloud.
- Optimize Cloud Application**
Connect to Google, Microsoft, Zoom and others using the Cloud.

Select a Cloud application to route through SpeedFusion Cloud from the drop down list > Click + > Save > Apply Changes. Click the × to remove a selected Cloud application to route through SpeedFusion Cloud.

SpeedFusion Cloud > Optimize Cloud Application

Traffic of the selected cloud application will be redirected to the assigned cloud.

Configuring the LAN Interface(s)

Network Settings

LAN interface settings are located at **Network>LAN>Network Settings**. Navigating to that page will show the following dashboard:

LAN	VLAN	Network	
LAN	None	172.16.251.1/24	
VLAN1	1	2.2.2.2/24	X
VLAN2	2	3.3.3.3/24	X

This represents the LAN interfaces that are active on your router (including VLAN). A grey “X” means that the VLAN is used in other settings and cannot be deleted.

You can find which settings are using the VLAN by hovering over the grey “X”.

Alternatively, a red “X” means that there are no settings using the VLAN.

You can delete that VLAN by clicking the red “X”

Clicking any of the existing LAN interfaces (or creating a new one) will show the following:

IP Settings

IP Address (/24) ▼

IP Settings

IP Address	The IP address and subnet mask of the Pepwave router on the LAN.
-------------------	------------------------------------------------------------------

Network Settings		?
Name	<input type="text"/>	Help Close To define a layer-2 bridging based PepVPN, please click here .
VLAN ID	<input type="text"/>	
Inter-VLAN routing	<input checked="" type="checkbox"/>	

Network Settings	
Name	Enter a name for the LAN.
VLAN ID	Enter a number for your VLAN.
Inter-VLAN routing	Check this box to enable routing between virtual LANs.

Layer 2 PepVPN Bridging		?
PepVPN Profiles to Bridge	<input type="checkbox"/> No profile is available	Help Close If you want to enable DHCP Option 82 Injection, please click here . This allow the device to inject Option 82 with Router Name information before forwarding the DHCP Request packet to PepVPN peer, such that the DHCP Server can identify where does this request come from.
Spanning Tree Protocol	<input type="checkbox"/>	
Override IP Address when bridge connected	<input checked="" type="radio"/> Do not override <input type="radio"/> Static <input type="radio"/> By DHCP <input type="radio"/> As None	

DHCP Server	
Layer 2 PepVPN Bridging	
PepVPN Profiles to Bridge	The remote network of the selected PepVPN profiles will be bridged with this local LAN, creating a Layer 2 PepVPN, they will be connected and operate like a single LAN, and any broadcast or multicast packets will be sent over the VPN.
Remote Network Isolation	Enable this option if you want to block network traffic between the remote networks, this will not affect the connectivity between them and this local LAN.
Spanning Tree Protocol	Click the box will enable STP for this layer 2 profile bridge.
Override IP Address when bridge connected	Select "Do not override" if the LAN IP address and local DHCP server should remain unchanged after the Layer 2 PepVPN is up. If you choose to override IP address when the VPN is connected, the device will not act as a router, and most Layer 3 routing functions will cease to work.
DHCP Option 82	Click on the question Mark if you want to enable DHCP Option 82. This allows the device to inject Option 82 with Router Name information before forwarding the DHCP Request packet to a PepVPN peer, such that the DHCP Server can identify where the request originates from.

DHCP Server			
DHCP Server	<input checked="" type="checkbox"/>	Enable	
DHCP Server Logging	<div style="border: 1px solid black; padding: 2px;"> Help Close Check the <i>Enable</i> box to enable the built-in DHCP server which serves DHCP requests on the LAN. If you want to enable DHCP relay server, click here. </div>		
IP Range		255.255.255.0 (/24)	
Lease Time		0 Mins	
DNS Servers	<input checked="" type="checkbox"/>	Assign DNS server automatically	
BOOTP	<input type="checkbox"/>		
Extended DHCP Option	Option	Value	
	<i>No Extended DHCP Option</i>		
	Add		
DHCP Reservation	<input type="checkbox"/>		
		Name	MAC Address
			Static IP
		00:00:00:00:00:00	+

DHCP Server Settings	
DHCP Server	When this setting is enabled, the DHCP server automatically assigns an IP address to each computer that is connected via LAN and configured to obtain an IP address via DHCP. The Pepwave router's DHCP server can prevent IP address collision on the LAN.
DHCP Server Logging	Enable logging of DHCP events in the eventlog by selecting the checkbox.
IP Range & Subnet Mask	These settings allocate a range of IP addresses that will be assigned to LAN computers by the Pepwave router's DHCP server.
Lease Time	This setting specifies the length of time throughout which an IP address of a DHCP client remains valid. Upon expiration of the lease time, the assigned IP address will no longer be valid and renewal of the IP address assignment will be required.
DNS Servers	This option allows you to input the DNS server addresses to be offered to DHCP clients. If Assign DNS server automatically is selected, the Pepwave router's built-in DNS server address (i.e., LAN IP address) will be offered.
BOOTP	Check this box to enable BOOTP on older networks that still require it.
Extended DHCP Option	In addition to standard DHCP options (e.g., DNS server address, gateway address, subnet mask), you can specify the value of additional extended DHCP options, as defined in RFC 2132. With these extended options enabled, you can pass additional configuration information to LAN hosts. To define an extended DHCP option, click the Add button, choose the option to define and enter its value. For values that are in IP address list format, you can enter one IP address per line in the provided text area input control. Each option can be defined once only.
DHCP Reservation	This setting reserves the assignment of fixed IP addresses for a list of computers on the LAN. The computers to be assigned fixed IP addresses on the LAN are identified by their MAC addresses. The fixed IP address assignment is displayed as a cross-reference list between the computers' names, MAC addresses, and fixed IP addresses. Name (an optional field) allows you to specify a name to represent the device. MAC addresses should be in the format of 00:AA:BB:CC:DD:EE . Press  to create a new record. Press  to remove a record. Reserved client information can be imported from the Client List , located at Status>Client List . For more details, please refer to Section 22.3 .

DHCP Relay Settings	
DHCP Relay	<input checked="" type="checkbox"/> Enable
DHCP Server IP Address	DHCP Server 1: <input type="text"/> DHCP Server 2: <input type="text"/>
DHCP Option 82	<input type="checkbox"/>
DHCP Relay Logging	<input type="checkbox"/>

DHCP Relay Settings	
DHCP Relay	Enter the address of the DHCP server here. DHCP requests will be relayed to it.
DHCP Server IP Address	DHCP requests from the LAN are relayed to the entered DHCP server. For active-passive DHCP server configurations, enter active and passive DHCP server IPs into the DHCP Server 1 and DHCP Server 2 fields.
DHCP Option 82	This feature includes device information as relay agent for the attached client when forwarding DHCP requests from a DHCP client to a DHCP server. Device MAC address and network name are embedded to circuit ID and Remote ID in option 82.
DHCP Relay Logging	Check this box to log DHCP relay activity.

Drop-In Mode

Drop-in mode (or transparent bridging mode) eases the installation of the Surf SOHO on a live network between the firewall and router, such that changes to the settings of existing equipment are not required.

The following diagram illustrates drop-in mode setup:

Check the box Enable to enable the Drop-in Mode. After enabling this feature and selecting the WAN for Drop-in mode, various settings including the WAN's connection method and IP address will be automatically updated.

When drop-in mode is enabled, the LAN and the WAN for drop-in mode ports will be bridged. Traffic between the LAN

hosts and WAN router will be forwarded between the devices. In this case, the hosts on both sides will not notice any IP or MAC address changes.

After successfully setting up the Surf SOHO as part of the network using drop-in mode, it will, depending on model, support one or more WAN connections. Some SOHO units also support multiple WAN connections after activating drop-in mode, though a SpeedFusion license may be required to activate more than one WAN port.

Please note the Drop-In Mode is mutually exclusive with VLAN.

Drop-In Mode Settings							
Enable	<input checked="" type="checkbox"/>						
WAN for Drop-In Mode	? WAN <input checked="" type="checkbox"/> Apply NAT on VLAN networks outgoing Internet traffic VLAN network(s) may route their outgoing Internet traffic to this unit. When this checkbox is checked their traffic will be NAT'd before forwarding out of this WAN. Leave this checkbox checked if you are not sure.						
Share Drop-In IP	<input checked="" type="checkbox"/>						
Shared IP Address	<input type="text"/> 255.255.255.0 (/24) <input type="button" value="v"/>						
Static Route	<table border="1"> <thead> <tr> <th>Destination Network</th> <th>Subnet Mask</th> <th></th> </tr> </thead> <tbody> <tr> <td><input type="text"/></td> <td>255.255.255.0 (/24) <input type="button" value="v"/></td> <td><input type="button" value="+"/></td> </tr> </tbody> </table>	Destination Network	Subnet Mask		<input type="text"/>	255.255.255.0 (/24) <input type="button" value="v"/>	<input type="button" value="+"/>
Destination Network	Subnet Mask						
<input type="text"/>	255.255.255.0 (/24) <input type="button" value="v"/>	<input type="button" value="+"/>					
WAN Default Gateway	? <input type="text"/> <input checked="" type="checkbox"/> I have other host(s) on WAN segment IP Address <input type="text"/> - <input type="text"/> <input type="button" value="v"/> <input type="button" value="x"/>						
WAN DNS Servers	? DNS server 1: <input type="text"/> DNS server 2: <input type="text"/>						
NOTE: The DHCP Server Settings will be overwritten. The following WAN settings will be overwritten: Connection Method, MTU, Health Check, Additional Public IP, and Dynamic DNS Settings. The PPTP Server will be disabled. Tip: please review the DNS Forwarding setting under the Service Forwarding section.							

Drop-in Mode Settings	
Enable	Drop-in mode eases the installation of the Surf SOHO on a live network between the existing firewall and router, such that no configuration changes are required on existing equipment. Check the box to enable the drop-in mode feature.
WAN for Drop-In Mode	Select the WAN port to be used for drop-in mode. If WAN is selected, the high availability feature will be disabled automatically.
Shared Drop-In IP^A	When this option is enabled, the passthrough IP address will be used to connect to WAN hosts (email notification, remote syslog, etc.). The SOHO will listen for this IP address when WAN hosts access services provided by the SOHO (web admin access from the WAN, DNS server requests, etc.). To connect to hosts on the LAN (email notification, remote syslog, etc.), the default gateway address will be used. The SOHO will listen for this IP address when LAN hosts access services provided by the SOHO(web admin access from the WAN, DNS proxy, etc.).

Shared IP Address^A	Access to this IP address will be passed through to the LAN port if this device is not serving the service being accessed. The shared IP address will be used in connecting to hosts on the WAN (e.g., email notification, remote syslog, etc.) The device will also listen on the IP address when hosts on the WAN access services served on this device (e.g., web admin accesses from WAN, DNS server, etc.)
WAN Default Gateway	Enter the WAN router's IP address in this field. If there are more hosts in addition to the router on the WAN segment, click the  button next to "WAN Default Gateway" and check the other host(s) on the WAN segment box and enter the IP address of the hosts that need to access LAN devices or be accessed by others.
WAN DNS Servers	Enter the selected WAN's corresponding DNS server IP addresses.

^A - Advanced feature, please click the  button on the top right-hand corner to activate.

Static Route Settings 			
Static Route	Destination Network	Subnet Mask	Gateway
	192.168.113.0	255.255.255.0 (/24) ▾	192.168.112.10 
		255.255.255.0 (/24) ▾	

Static Route Settings

Static Route

This table is for defining static routing rules for the LAN segment. A static route consists of the network address, subnet mask, and gateway address. The address and subnet mask values are in w.x.y.z format.

The local LAN subnet and subnets behind the LAN will be advertised to the VPN. Remote routes sent over the VPN will also be accepted. Any VPN member will be able to route to the local subnets. Press  to create a new route. Press  to remove a route.

Entries in this list will allow traffic to route to a different subnet that is connected to the LAN interface. Any traffic destined for a network/mask pair will be directed to the corresponding gateway instead of routed through WANs.

Virtual Network Mapping 			
One-to-One NAT 	Local Network	Virtual Network	
Many-to-One NAT 	Local Network	Virtual IP Address	

In case of a network address conflict with remote peers (i.e. PepVPN / IPsec VPN / IP Forwarding WAN are considered as remote connections), you can define Virtual Network Mapping to resolve it.

Note: OSPF & RIPv2 settings should be updated as well to avoid advertising conflicted network.

For further details on virtual network mapping watch this video: <https://youtu.be/C1FMdZCn3Z8>

Virtual Network Mapping

One-to-One NAT

Every IP Address in the Local Network has a corresponding unique Virtual IP Address for NAT. Traffic originating from the Local Network to remote connections will be SNAT'ed and behave like coming from the defined Virtual Network.

While traffic initiated by remote peers to the Virtual Network will be DNAT'ed accordingly.

Many-to-One NAT

The subnet range defined in Local Network will be mapped to a single Virtual IP Address for NAT. Traffic can only be initiated from local to remote, and these traffic will be NAT'ed and behaves like coming from the same Virtual IP Address.

DNS Proxy Settings

Enable	<p>To enable the DNS proxy feature, check this box, and then set up the feature at Network>LAN>DNS Proxy Settings.</p> <p>A DNS proxy server can be enabled to serve DNS requests originating from LAN/PPTP/SpeedFusion™ peers. Requests are forwarded to the DNS servers/resolvers defined for each WAN connection.</p>
DNS Caching	<p>This field is to enable DNS caching on the built-in DNS proxy server. When the option is enabled, queried DNS replies will be cached until the records' TTL has been reached. This feature can improve DNS response time by storing all received DNS results for faster DNS lookup. However, it cannot return the most updated result for frequently updated DNS records. By default, DNS Caching is disabled.</p>
Include Google Public DNS Servers	<p>When this option is enabled, the DNS proxy server will forward DNS requests to Google's public DNS servers, in addition to the DNS servers defined in each WAN. This could increase the DNS service's availability. This setting is disabled by default.</p>
Local DNS Records	<p>This table is for defining custom local DNS records. A static local DNS record consists of a host name and IP address. When looking up the host name from the LAN to LAN IP of the Pepwave Surf SOHO, the corresponding IP address will be returned. To display the option to set TTL manually, click ?.</p>

Click  to create a new record. Click  to remove a record.

Domain Lookup Policy

DNS proxy will look up the domain names defined here using only the specified connections.

DNS Resolvers^A

Check the box to enable the WINS server. A list of WINS clients will be displayed at **Network>LAN>DNS Proxy Settings>DNS Resolvers**.

This field specifies which DNS resolvers will receive forwarded DNS requests. If no WAN/VPN/LAN DNS resolver is selected, all of the WAN's DNS resolvers will be selected. If a SpeedFusion™ peer is selected, you may enter the VPN peer's DNS resolver IP address(es). Queries will be forwarded to the selected connections' resolvers. If all of the selected connections are down, queries will be forwarded to all resolvers on healthy WAN connections.

^A - Advanced feature, please click the  button on the top right-hand corner to activate.

Port Settings

To configure port settings, navigate to **Network > LAN > Port Settings**

Port Settings				
	Name	Enable	Speed	Advertise Speed
1	LAN Port 1	<input checked="" type="checkbox"/>		
2	LAN Port 2	<input checked="" type="checkbox"/>		
3	LAN Port 3	<input checked="" type="checkbox"/>		
4	LAN Port 4	<input checked="" type="checkbox"/>		

Save

On this screen, you can enable specific ports, name the LAN ports, as well as determine the speed of the LAN ports.

LAN Physical Settings

Speed

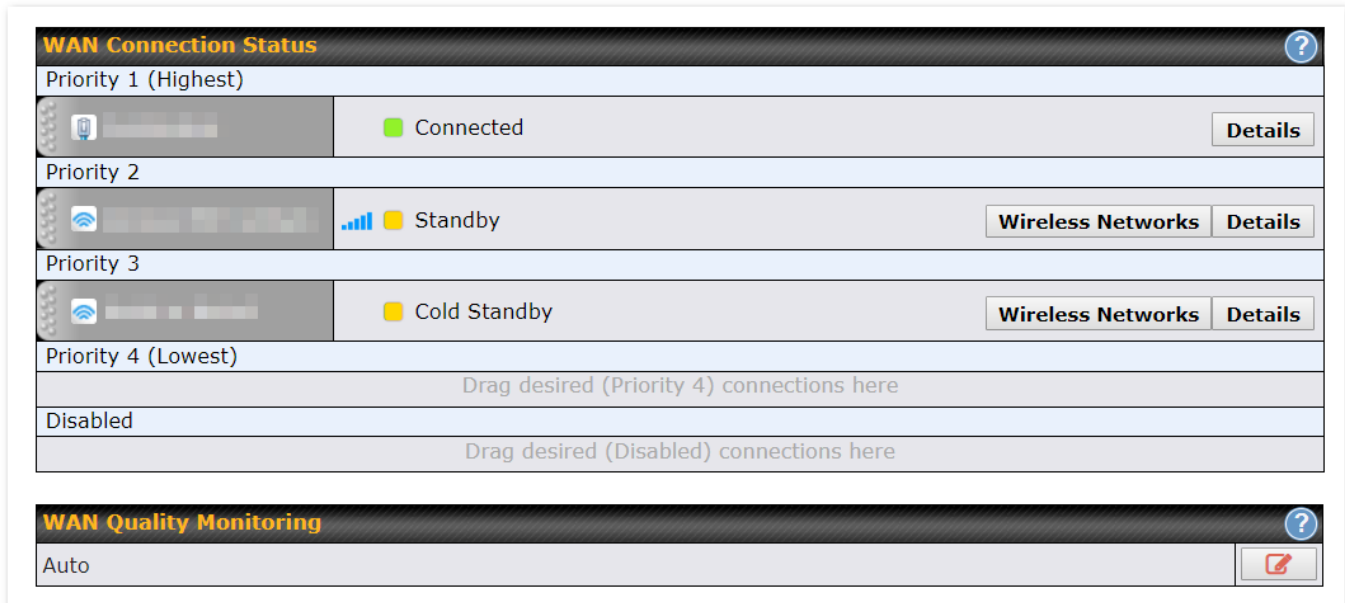

This is the port speed of the LAN interface. It should be set to the same speed as the connected device to avoid port negotiation problems. When a static speed is set, you may choose whether to advertise its speed to the peer device. **Auto** is selected by default. You can choose not to advertise the port speed if the port has difficulty negotiating with the peer device.

Configuring the WAN interface

WAN Interface settings are located at **Network>WAN**.

The router supports wan connections supplied by a USB 2.0 Interface USB cellular modem, Ethernet, or Wi-Fi.

To reorder the WAN priority, drag on the appropriate WAN by holding the left mouse button, move it to the desired priority (the first one would be the highest priority, the second one would be lower priority, and so on), and drop it by releasing the mouse button.

To disable a particular WAN connection, drag on the appropriate WAN by holding the left mouse button, move it to the **Disabled** row, and drop it by releasing the mouse button.

You can also set priorities on the **Dashboard**. Click the **Details** button in the corresponding row to modify the connection setting.

WAN > Quality Monitoring

This setting advice how WAN Quality information is being gathered.

By default, WAN Quality information will always be collected automatically for all WAN connections.

With a customized choice of WAN connections, the router will only collect the WAN Quality information of those selected WAN connections.

Important Note

Connection details will be changed and become effective immediately after clicking the **Save and Apply** button.

WAN > Ethernet WAN

WAN connection details need to be configured to connect the router to the internet or another WAN

To start configuring the WAN connection choose **Network>WAN** from the menu and choose a WAN connection and then click **Details**.

WAN Connection Settings	
WAN Connection Name	<input type="text"/> Default
Connection Method	<input type="button" value="?"/> DHCP ▾
Routing Mode	<input type="button" value="?"/> <input checked="" type="radio"/> NAT
Hostname (Optional)	<input type="text"/> <input type="checkbox"/> Use custom hostname
DNS Servers	<input checked="" type="checkbox"/> Obtain DNS server address automatically <input type="checkbox"/> Use the following DNS server address(es) DNS Server 1: <input type="text"/> DNS Server 2: <input type="text"/>
IP Passthrough	<input type="button" value="?"/> <input type="checkbox"/>
Independent from Backup WANs	<input type="button" value="?"/> <input type="checkbox"/>
Standby State	<input type="button" value="?"/> <input checked="" type="radio"/> Remain connected <input type="radio"/> Disconnect
Reply to ICMP Ping	<input type="button" value="?"/> <input checked="" type="radio"/> Yes <input type="radio"/> No
Upload Bandwidth	<input type="button" value="?"/> 10 <input type="text"/> Mbps ▾
Download Bandwidth	<input type="button" value="?"/> 110 <input type="text"/> Mbps ▾

WAN Connection Settings	
WAN Connection Name	Enter a name to represent this WAN connection.
Schedule	Click the drop-down menu to apply a time schedule to this interface (only visible if Schedules have been created in System > Schedule)
Connection Method	<p>There are five possible connection methods for Ethernet WAN:</p> <ul style="list-style-type: none"> • DHCP • Static IP • PPPoE • L2TP • GRE <p>The connection method and details are determined by, and can be obtained from the ISP.</p>
Routing Mode	This field shows that NAT (network address translation) will be applied to the traffic routed over this WAN connection. IP Forwarding is available when you click the link in the help text.

Hostname (Optional)	Provide a hostname for this WAN port if requested by the ISP
Management IP Address	<p>Management IP Address is available for configuration when you click the link in the help icon via the Hostname. </p> <p>This option allows you to configure the management IP address for the DHCP WAN connection.</p>
DNS Servers	Select a DNS server for this port to use. This port can either be automatically selected or manually designated.
Ip Passthrough	When this IP Passthrough option is active, after the ethernet WAN connection is up, the router's DHCP server will offer the connection's IP address to one LAN client. All incoming or outgoing traffic will be routed without NAT.
Independent from Backup WANs	If this is checked, the connection will be working independent from other Backup WAN connections. Those in Backup Priority will ignore the status of this WAN connection, and will be used when none of the other higher priority connections are available
Standby State	This option allows you to choose whether to remain the connection connected or disconnect it when this WAN connection is no longer in the highest priority and has entered the standby state.
Reply to ICMP Ping	If No is selected, this option is disabled and the system will not reply to any ICMP ping echo requests to the WAN IP addresses of this WAN connection(Default option is "Yes")
Upload Bandwidth	<p>This field refers to the maximum upload speed.</p> <p>This value is referenced when default weight is chosen for outbound traffic and traffic prioritization. A correct value can result in effective traffic prioritization and efficient use of upstream bandwidth.</p>
Download Bandwidth	<p>This field refers to the maximum download speed.</p> <p>Default weight control for outbound traffic will be adjusted according to this value.</p>

WAN > Physical Interface Settings

Physical Interface Settings	
Port Speed	This setting specifies port speed and duplex configurations of the WAN port. By default, Auto is selected and the appropriate data speed is automatically detected by the Pepwave router. In the event of negotiation issues, the port speed can be manually specified. You can also choose whether or not to advertise the speed to the peer by selecting the Advertise Speed checkbox.
MTU	This setting specifies the maximum transmission unit. By default, MTU is set to Custom 1440 . You may adjust the MTU value by editing the text field. Click Default to restore the default MTU value. Select Auto and the appropriate MTU value will be automatically detected. Auto-detection will run each time the WAN connection establishes.
MSS	This setting should be configured based on the maximum payload size that the local system can handle. The MSS (maximum segment size) is computed from the MTU minus 40 bytes for TCP over IPv4. If the MTU is set to Auto , the MSS will also be set automatically. By default, MSS is

set to **Auto**.

Physical Interface Settings

MAC Address Clone

Some service providers (e.g., cable providers) identify the client's MAC address and require the client to always use the same MAC address to connect to the network. In such cases, change the WAN interface's MAC address to the original client PC's MAC address via this field. The default MAC address is a unique value assigned at the factory. In most cases, the default value is sufficient. Clicking **Default** restores the MAC address to the default value.

VLAN

Click the square if you wish to enable VLAN functionality for the WAN connection and enable multiple broadcast domains. Once you enable VLAN, you will be able to enter a name for your network.

WAN > Health Check Settings

To ensure traffic is routed to healthy WAN connections only, the Pepwave router can periodically check the health of each WAN connection. The health check settings for each WAN connection can be independently configured.

Health Check Settings	
Health Check Method	? PING ▾
PING Hosts	? Host 1: <input type="text"/> Host 2: <input type="text"/> <input checked="" type="checkbox"/> Use first two DNS servers as PING Hosts
Timeout	? 5 ▾ second(s)
Health Check Interval	? 5 ▾ second(s)
Health Check Retries	? 3 ▾
Recovery Retries	? 3 ▾

Health Check Methods

PING: The router will send an ICMP/PING packet to the specified IP address (or host name) to test WAN connectivity.

DNS Lookup: The router will perform a DNS lookup to the specified DNS server.

HTTP: The router will perform an HTTP request to the specified URLs. Optional with strings to match.

SmartCheck: Available in Cellular/USB WAN only, SmartCheck initiates when outbound traffic goes unresponded for 10 seconds. When SmartCheck initiates, it will run an ICMP health check.

Health Check Parameters

Timeout: During any health check, the router will send a health check packet. The router will wait the specified number of seconds for a response before the health check is considered as failed.

Health Check Interval: This number specifies the period between each health check.

Health Check Retries: This number specified the number of health check attempts the router will make. Upon reaching this number, the link will be considered as failed

Recovery Retries: This specified the number of successful health checks a failed links needs before the link is considered as up again.

WAN > Bandwidth Allowance Monitor

The Bandwidth Allowance Monitor helps to keep track of your network usage.

To enable this function, connect to the Web Admin Interface and go to **Network > WAN**.

Check the box **Enable** next to Bandwidth Allowance Monitor and you can see the following:

Bandwidth Allowance Monitor	
Bandwidth Allowance Monitor ?	<input checked="" type="checkbox"/> Enable
Action ?	Email notification is currently disabled. You can get notified when usage hits 75%/95% of monthly allowance by enabling Email Notification . <input type="checkbox"/> Reserve for management traffic when usage hits 100% of monthly allowance <input checked="" type="checkbox"/> Disconnect when usage hits 100% of monthly allowance
Start Day ?	On 1st ▼ of each month at 00:00 midnight
Monthly Allowance ?	<input type="text"/> GB ▼

Action: If the feature **Email Notification** is enabled, you will be notified through email when usage hits 75% and 95% of the monthly allowance.

If the box **Disconnect when usage hits 100% of monthly allowance** is checked, this WAN connection will be disconnected automatically when the usage hits the monthly allowance. It will not resume connection unless this option has been turned off or the usage has been reset when a new billing cycle starts.

Start Day: This option allows you to define which day in the month each billing cycle begins.

Monthly Allowance: This field is for defining the maximum bandwidth usage allowed for the WAN connection each month.

WAN > Additional IP Address Settings

The **IP Address** list represents the list of fixed Internet IP addresses assigned by the ISP, in the event that more than one Internet IP address is assigned to this WAN connection.

Enter the subnet IP Address and Subnet Mask, press the down arrow button, and the list will be populated by the IP addresses of the specified subnet. You should delete the WAN connection's primary IP address and the gateway address from the list by pressing the *Delete* button after selecting them in the list.

These additional IP addresses can be assigned to a device on the LAN using NAT Mappings

WAN > Dynamic DNS Settings

Pepwave Surf SOHO routers allow registering domain name relationships to dynamic DNS service providers. Through registration with dynamic DNS service provider(s), the default public Internet IP address of each WAN connection can be associated with a hostname.

With dynamic DNS service enabled for a WAN connection, you can connect to your WAN's IP address externally even if its IP address is dynamic.

You must register for an account from the listed dynamic DNS service providers before enabling this option.

If the WAN connection's IP address is a reserved private IP address (i.e., behind a NAT router), the public IP of each WAN will be automatically reported to the DNS service provider.

Either upon a change in IP addresses or every 23 days without link reconnection, the Pepwave Surf SOHO will connect to the dynamic DNS service provider to update the provider's IP address records.

If your desired provider is not listed, you may check with **DNS-O-Matic**. This service supports updating 30 other dynamic

DNS service providers. (Note: Peplink is not affiliated with DNS-O-Matic.)

Wi-Fi WAN and USB WiFi Network connection

To access Wi-Fi WAN settings, click **Network>WAN>Wireless network connection**.

The WiFi-WAN and USB WiFi Network connection configuration is similar to the Ethernet WAN configuration, but has a few unique options that are shown in this section.

The options that are the same as the ethernet WAN connection configuration are shown in the Ethernet WAN section.

Preferred BSSID	Configure the BSSID; the BSSID is the MAC address of the wireless access point (WAP)
Connection Method	Choose DHCP or Static IP
DNS servers	Configure the DNS servers that this WAN connection should use

WAN > Signal threshold settings

If signal threshold is defined, this connection will be treated as down when a weaker than threshold signal is determined. The signal threshold can also be configured using values (this option can be enabled after selecting the question mark)

Indication of WiFi strength values:

Signal Strength	Quality indication
-30 dBm	Maximum signal strength
-50 dBm	Excellent signal strength
-60 dBm	Good, reliable signal strength
-67 dBm	Minimum signal strength for applications that require very reliable, timely delivery of data packets.
-70 dBm	Not strong; goof for soet internet browsing and email
-80 dBm	Unreliable
-90 dBm	Unusable

PepVPN

PepVPN is the core engine of Peplink site-to-site VPN technology.

It is ideal for establishing a secure tunnel over any WAN link.

On top of all the benefits of IPsec and other conventional VPN technologies, the PepVPN engine also offers:

Long-distance Ethernet cable – PepVPN allows a secure and seamless Ethernet tunnel over any IP connection (Layer 2 over Layer 3). It virtually provides a long-distance Ethernet cable over any WAN link.

Works in any dynamic IP environment – PepVPN is fully compatible with any dynamic IP environment and NAT, allowing you to establish a VPN behind a NAT gateway or firewall without worrying about static IP addresses (one public IP address is needed to establish a PeVPN Connection).

To start, navigate to Network > VPN > SpeedFusion and enter a Local ID and click save.

This device will be identified by other SpeedFusion Peers by this local ID

When a PepVPN connection is established between sites, the local LAN subnet and subnets behind the LAN (defined under **Static Route** on the LAN settings page) will be advertised to the VPN. All VPN members (branch offices and headquarters) will be able to route to local subnets.

Note that all LAN subnets and the subnets behind them must be unique. Otherwise, VPN members will not be able to access each other.

All data can be routed over the VPN using the 256-bit AES encryption standard. Each profile specifies the settings for creating a VPN connection with one remote Pepwave or Peplink device.

The Pepwave Surf Soho supports 2 PepVPN remote peers per device (5 with upgrade license).

PepVPN Profile Settings	
Name	This field is for specifying a name to represent this profile. The name can be any combination of alphanumeric characters (0-9, A-Z, a-z), underscores (_), dashes (-), and/or non-leading/trailing spaces ().
Active	When this box is checked, this VPN connection profile will be enabled. Otherwise, it will be disabled.
Encryption	By default, VPN traffic is encrypted with 256-bit AES . If Off is selected on both sides of a VPN connection, no encryption will be applied.
Authentication	Select from By Remote ID Only , Pre-shared Key . When selecting By Remote ID Only , be sure to enter a unique peer ID number in the Remote ID field.
Remote ID / Pre-shared Key	This optional field becomes available when Remote ID / Pre-shared Key is selected as the Pepwave Surf SOHO's VPN Authentication method, as explained above. Pre-shared Key defines the pre-shared key used for this particular VPN connection. The VPN connection's session key will be further protected by the pre-shared key. The connection will be up only if the pre-shared keys on each side match. When the peer is running firmware 5.0+, this setting will be ignored.
NAT Mode	Check this box to allow the local DHCP server to assign an IP address to the remote peer. When NAT Mode is enabled, all remote traffic over the VPN will be tagged with the assigned IP address using network address translation.
Remote IP Address / Host Names (Optional)	<p>If NAT Mode is not enabled, you can enter a remote peer's WAN IP address or hostname(s) here. If the remote uses more than one address, enter only one of them here. Multiple hostnames are allowed and can be separated by a space character or carriage return. Dynamic-DNS host names are also accepted.</p> <p>This field is optional. With this field filled, the Pepwave Surf SOHO will initiate connection to each of the remote IP addresses until it succeeds in making a connection. If the field is empty, the Pepwave Surf SOHO will wait for connection from the remote peer. Therefore, at least one of the two VPN peers must specify this value. Otherwise, VPN connections cannot be established.</p> <p>Click the  icon to configure data stream using TCP protocol [EXPERIMENTAL]. In the case TCP protocol is used, the exposed TCP session option can be authorised to work with TCP accelerated WAN link.</p>
Cost	<p>Define path cost for this profile.</p> <p>OSPF will determine the best route through the network using the assigned cost.</p> <p>Default: 10</p>
Data Port	This field is used to specify a UDP or TCP port number for transporting outgoing VPN data. If Default is selected, UDP port 4500 will be used. Port 32015 will be used if port 4500 is unavailable. If Custom is selected, enter an outgoing port number from 1 to 65535.
Bandwidth Limit	Define maximum download and upload speed to each individual peer. This functionality requires the peer to use PepVPN version 4.0.0 or above.
Receive Buffer	Receive Buffer can help to reduce out-of-order packets and jitter, but will introduce extra latency to the tunnel. Default is 0 ms, which disable the buffer, and maximum buffer size is 2000 ms.

Multiple PepVPN profiles between the same 2 sites Enable this advanced feature to create up to 5 PepVPN tunnels from your router to the same remote location, each with different behavior.
See: <https://forum.peplink.com/t/outbound-policies-within-a-pepvpn-or-speedfusion-tunnel/>

PepVPN > Send ALL traffic

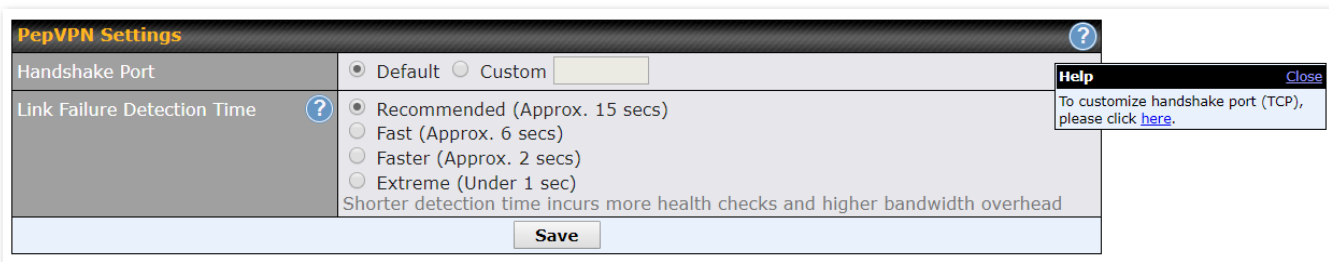

This feature allows you to redirect all traffic to a specified PepVPN connection. Click the  button to select your connection and the following menu will appear:

You can (optionally) specify a DNS server to resolve incoming DNS requests. Click the checkbox next to **Backup Site** to designate a backup SpeedFusion profile that will take over should the main PepVPN connection fail.

Handshake Port and Link Failure Detection Time

Handshake Port

Click the  icon to customize the handshake port (TCP) used to initialize the PepVPN connection. The handshake uses TCP port 32015 by default.

Link Failure Detection Time

The bonded VPN can detect routing failures on the path between two sites over each WAN connection. Failed WAN connections will not be used to route VPN traffic. Health check packets are sent to the remote unit to detect any failure. The more frequently checks are sent, the shorter the detection time, although more bandwidth will be consumed.

- When Recommended (default) is selected, a health check packet is sent every five seconds, and the expected detection time is 15 seconds.
- When Fast is selected, a health check packet is sent every three seconds, and the expected detection time is six seconds.
- When Faster is selected, a health check packet is sent every second, and the expected detection time is two seconds.
- When Extreme is selected, a health check packet is sent every 0.1 second, and the expected detection time is less than one second.

Outbound Policy Management

Pepwave routers can flexibly manage and load balance outbound traffic among WAN connections.

Important Note	
Outbound policies are applied only when more than one WAN connection is active.	

The settings for managing and load balancing outbound traffic are located at **Advanced > PepVPN**

The screenshot below shows the Outbound Policy window with Expert mode enabled.

Rules (Drag and drop rows by the left to change rule order)					
Service	Algorithm	Source	Destination	Protocol / Port	
PepVPN / OSPF / BGP / RIPv2 Routes					
HTTPS Persistence	Enforced WAN: WAN	Any	Any	TCP 443	✖
<input type="button" value="Add Rule"/>					

The bottom-most rule HTTPS_Persistence is **Default**. This rule manages the device's default manner of controlling outbound traffic for all connections that do not match any of the rules above it.

To rearrange the priority of outbound rules, drag and drop them into the desired sequence.

Under Expert Mode, a special rule is displayed on the Custom Rules table which is "PepVPN Routes". It presents all PepVPN routes learned from remote VPN peers. By default, this bar is on the top of all custom rules. That means traffic for remote VPN subnets will be routed to its corresponding VPN peer. You can create custom Priority or Enforced rules and move them above the bar to override the PepVPN Routes.

Upon disabling the Expert Mode, all rules above the bar will be deleted.

Adding new Custom Outbound Policies

To add new custom rules (Outbound Policies) select Add Rule.

The Pepwave Surf SOHO supports 2 algorithms for the Outbound Policies, Enforced and Priority.

The options for Outbound policies are:

Add a New Custom Rule
✕

Service Name	<input style="width: 95%;" type="text"/>		
Enable	<input checked="" type="checkbox"/>		
Source	Any ▾		
Destination	IP Network ▾	<input style="width: 100px;" type="text"/>	Mask: 255.255.255.0 (/24) ▾
Protocol	Any ▾	← :: Protocol Selection :: ▾	
Algorithm	Enforced ▾		
Enforced Connection	<input type="checkbox"/>		

Default Outbound Policy Settings

Service Name This field is for specifying a name to represent this profile. The name can be any combination of alphanumeric characters (0-9, A-Z, a-z), underscores (_), dashes (-), and/or non-leading/trailing spaces ().

Enable When this box is checked, this outbound policy will be enabled. Otherwise, it will be disabled.

Source This setting specifies the source IP address, IP network, MAC address or Client's Associated SSID for traffic that matches the rule.

Source	?	Any ▾
Destination	?	Any IP Address IP Network MAC Address Client's Associated SSID
Protocol	?	

Destination This setting specifies the destination IP address, IP network, Domain name, SpeedFusion Cloud, PepVPN Profile or Grouped network for traffic that matches the rule.

Protocol

This setting specifies the IP protocol and port of traffic that matches this rule. Via a drop-down menu, the following protocols can be specified:

- Any
- TCP
- UDP
- IP
- DSCP

Alternatively, the **Protocol Selection Tool** drop-down menu can be used to automatically fill in the protocol and port number of common Internet services (e.g., HTTP, HTTPS, etc.) After selecting an item from the **Protocol Selection Tool** drop-down menu, the protocol and port number remains manually modifiable.

Algorithm

This setting specifies the behavior of the Pepwave router for the custom rule.

One of the following values can be selected:

- Enforced : Enforce traffic matching this rule through a selected WAN or VPN connection.
- Priority: Prioritise traffic matching this rule through selected WAN or VPN connection(s)

Enforced Connection

Specify the WAN or VPN connection to be used for routing traffic regardless of the connection's health status.

When No Connections are Available

This field allows you to configure the default action when all the selected Connections are not available.

- Drop the Traffic - Traffic will be discarded.
- Use Any Available Connections - Traffic will be routed to any available Connection, even it is not selected in the list.
- Fall-through to Next Rule - Traffic will continue to match next Outbound Policy rule just like this rule is inactive.

Terminate Sessions on Connection Recovery

In the case when the highest priority connection is unavailable, matching sessions may routed through a lower priority connection or skipped to next matching rule (Fall-through to Next Rule). By checking this option, those sessions will be terminated upon connection recovery of any higher priority connections. Terminated sessions will go through all the rules again to determine the outgoing connection.

When Source is a MAC address, this option will be disabled automatically.

Default: Disable

Port Forwarding

Pepwave routers can act as a firewall that blocks, by default, all inbound access from the Internet. By using port forwarding, Internet users can access servers behind the Pepwave router. Inbound port forwarding rules can be defined at **Advanced>Port Forwarding**.

Service	IP Address(es)	Server	Protocol
No Services Defined			
<input type="button" value="Add Service"/>			

To define a new service, click **Add Service**.

Port Forwarding ✕

Enable	<input checked="" type="checkbox"/>

<input type="checkbox"/> [blurred]																			
<input type="checkbox"/> [blurred]																			
Server IP Address	<input type="text"/>																		

Port Forwarding Settings	
Enable	This setting specifies whether the inbound service takes effect. When Enable is checked, the inbound service takes effect: traffic is matched and actions are taken by the Pepwave router based on the other parameters of the rule. When this setting is disabled, the inbound service does not take effect: the Pepwave router disregards the other parameters of the rule.
Service Name	This setting identifies the service to the system administrator. Valid values for this setting consist of only alphanumeric and underscore “_” characters.
Protocol	The Protocol setting, along with the Port setting, specifies the protocol of the service as TCP, UDP, ICMP, or IP. Traffic that is received by the Pepwave router via the specified protocol at the specified port(s) is forwarded to the LAN hosts specified by the Servers setting. Please see below for details on the Port and Servers settings. Alternatively, the Protocol Selection Tool drop-down menu can be used to automatically fill in the protocol and a single port number of common Internet services (e.g. HTTP, HTTPS, etc.). After selecting an item from the Protocol Selection Tool drop-down menu, the protocol and port number remain

manually modifiable.

Port

The **Port** setting specifies the port(s) that correspond to the service, and can be configured to behave in one of the following manners:

Any Port, Single Port, Port Range, Port Map, and Range Mapping

Port	?	Any Port	
------	---	----------	--

Any Port: all traffic that is received by the Pepwave router via the specified protocol is forwarded to the servers specified by the **Servers** setting. For example, with **IP Protocol** set to **TCP**, and **Port** set to **Any Port**, all TCP traffic is forwarded to the configured servers.

Port	?	Single Port	Service Port: 80
------	---	-------------	------------------

Single Port: traffic that is received by the Pepwave router via the specified protocol at the specified port is forwarded via the same port to the servers specified by the **Servers** setting. For example, with **IP Protocol** set to **TCP**, and **Port** set to **Single Port** and **Service Port** 80, TCP traffic received on port 80 is forwarded to the configured servers via port 80.

Port	?	Port Range	Service Ports: 80 - 88
------	---	------------	------------------------

Port Range: traffic that is received by the Pepwave router via the specified protocol at the specified port range is forwarded via the same respective ports to the LAN hosts specified by the **Servers** setting. For example, with **IP Protocol** set to **TCP**, and **Port** set to **Port Range** and **Service Ports** 80-88, TCP traffic received on ports 80 through 88 is forwarded to the configured servers via the respective ports.

Port	?	Port Mapping	Service Port: 80	Map to Port: 88
------	---	--------------	------------------	-----------------

Port Mapping: traffic that is received by Pepwave router via the specified protocol at the specified port is forwarded via a different port to the servers specified by the **Servers** setting.

For example, with **IP Protocol** set to **TCP**, and **Port** set to **Port Mapping**, **Service Port** 80, and **Map to Port** 88, TCP traffic on port 80 is forwarded to the configured servers via port 88.

(Please see below for details on the **Servers** setting.)

Port	?	Range Mapping	Service Ports: 80 - 88	Map to Ports: 88 - 96
------	---	---------------	------------------------	-----------------------

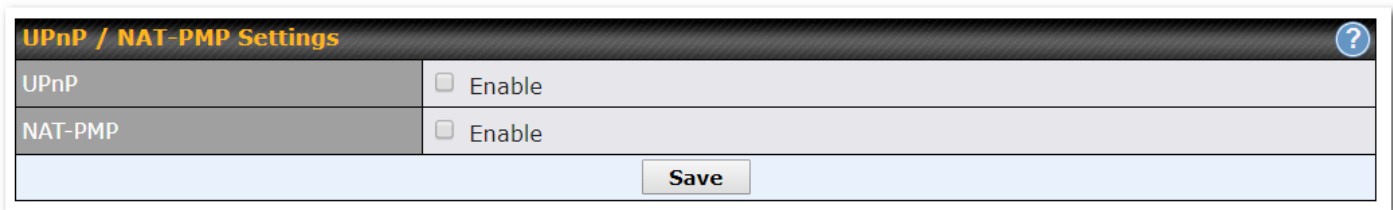

Range Mapping: traffic that is received by the Pepwave router via the specified protocol at the specified port range is forwarded via a different port to the servers specified by the **Servers** setting.

UPnP / NAT-PMP Settings

UPnP and NAT-PMP are network protocols which allow a computer connected to a LAN port or WiFi AP to automatically configure the router to allow parties on the WAN port to connect to itself. That way, the process of inbound port forwarding becomes automated.

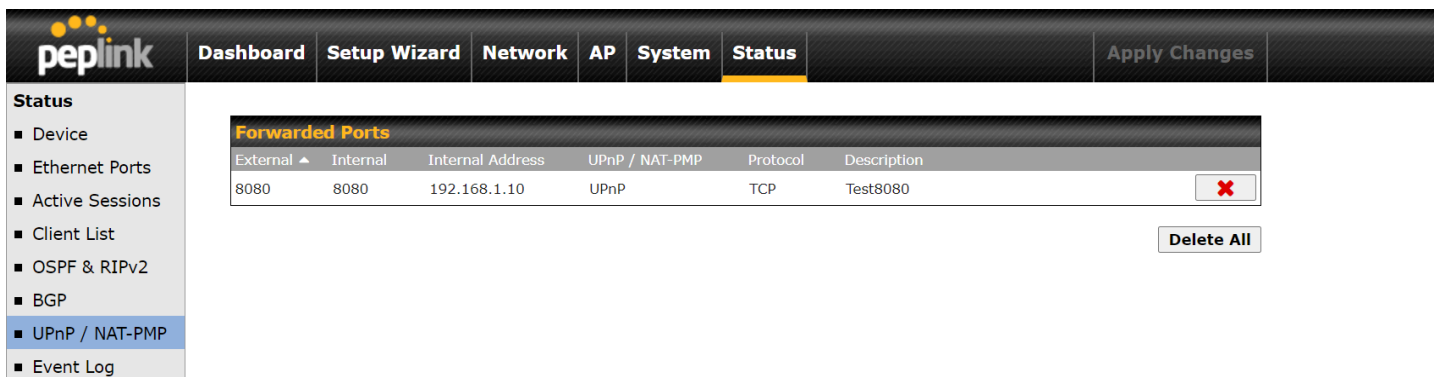

When a computer creates a rule using these protocols, the specified TCP/UDP port of all WAN connections' default IP address will be forwarded.

Check the corresponding box(es) to enable UPnP and/or NAT-PMP. Enable these features only if you trust the computers connected to a LAN port or WiFi AP.

UPnP / NAT-PMP Settings	
UPnP	<input type="checkbox"/> Enable
NAT-PMP	<input type="checkbox"/> Enable
<input type="button" value="Save"/>	

When the options are enabled, a table listing all the forwarded ports under these two protocols can be found at **Status>UPnP / NAT-PMP**.

External	Internal	Internal Address	UPnP / NAT-PMP	Protocol	Description
8080	8080	192.168.1.10	UPnP	TCP	Test8080

In the example above, the UPnP device is running. When the UPnP device is disconnected, the router will suspend the service and incoming traffic will be dropped (without error/notification message). The UPnP rule will remain for an interval after the UPnP device is disconnected before being removed.

NAT Mappings

NAT mappings allow IP address mapping of all inbound and outbound NAT'd traffic to and from an internal client IP address. Settings to configure NAT mappings are located at **Advanced>NAT Mappings**.

LAN Clients	Inbound Mappings	Outbound Mappings	
192.168.1.23	(WAN 1):10.88.3.158 (Interface IP)	Use <i>Interface IP</i> only	
Add NAT Rule			

To add a rule for NAT mappings, click **Add NAT Rule**.

NAT Mapping Settings

LAN Client(s)	NAT mapping rules can be defined for a single LAN IP Address , an IP Range , or an IP Network .
Address	This refers to the LAN host's private IP address. The system maps this address to a number of public IP addresses (specified below) in order to facilitate inbound and outbound traffic. This option is only available when IP Address is selected.
Range	The IP range is a contiguous group of private IP addresses used by the LAN host. The system maps these addresses to a number of public IP addresses (specified below) to facilitate outbound traffic. This option is only available when IP Range is selected.
Network	The IP network refers to all private IP addresses and ranges managed by the LAN host. The system maps these addresses to a number of public IP addresses (specified below) to facilitate outbound traffic.

This option is only available when **IP Network** is selected.

Inbound Mappings

This setting specifies the WAN connections and corresponding WAN-specific Internet IP addresses on which the system should bind. Any access to the specified WAN connection(s) and IP address(es) will be forwarded to the LAN host. This option is only available when **IP Address** is selected in the **LAN Client(s)** field.

Note that inbound mapping is not needed for WAN connections in drop-in mode or IP forwarding mode. Also note that each WAN IP address can be associated to one NAT mapping only.

Outbound Mappings

This setting specifies the WAN IP addresses that should be used when an IP connection is made from a LAN host to the Internet. Each LAN host in an IP range or IP network will be evenly mapped to one of each selected WAN's IP addresses (for better IP address utilization) in a persistent manner (for better application compatibility).

Note that if you do not want to use a specific WAN for outgoing accesses, you should still choose default here, then customize the outbound access rule in the **Outbound Policy** section. Also note that WAN connections in drop-in mode or IP forwarding mode are not shown here.

Click **Save** to save the settings when configuration has been completed.

Important Note

Inbound firewall rules override the **Inbound Mappings** settings.

QoS

Bandwidth Control

The default download and upload limits are set to unlimited (set as 0). This can be changed as necessary to restrict the speeds to individual devices connected to the router, either wired or wireless. Note, this limit is applied to all devices..

Individual Bandwidth Limit		
Enable	<input checked="" type="checkbox"/>	
User Bandwidth Limit	Download 0 <input type="text"/> Mbps ▾	Upload 0 <input type="text"/> Mbps ▾ (0: Unlimited)

Application Prioritization

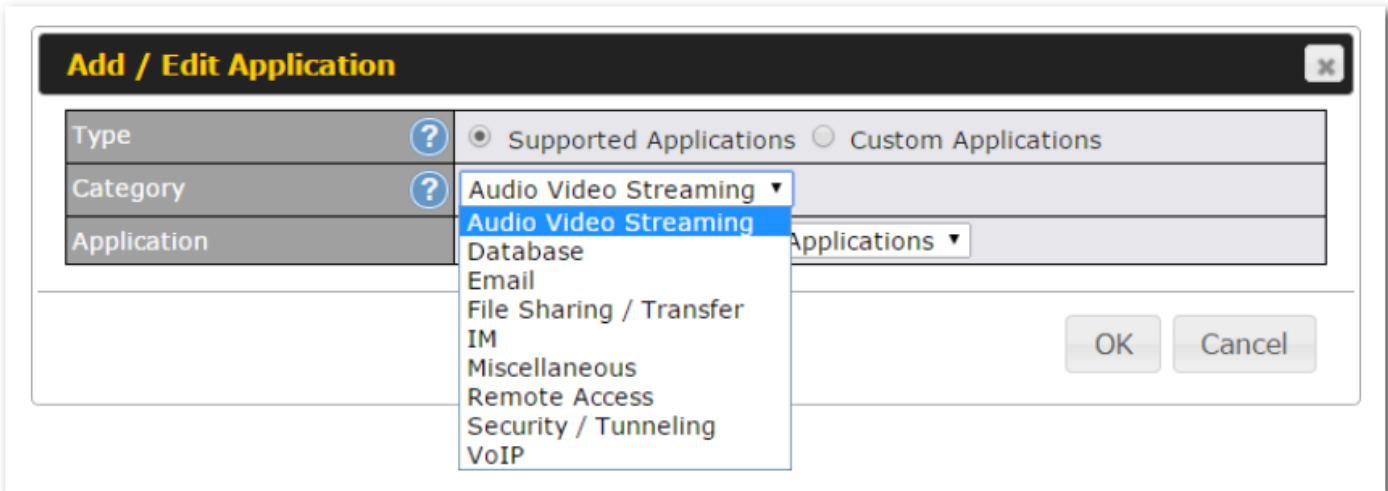

Three application priority levels can be set: ↑High, — Normal, and ↓Low. Pepwave routers can detect various application traffic types by inspecting the packet content. Select an application by choosing a supported application, or by defining a custom application manually. The priority preference of supported applications is placed at the top of the table. Custom applications are at the bottom.

Application	Priority	
	↑ High ▾	<input type="checkbox"/>
	↑ High ▾	<input type="checkbox"/>
	↑ High ▾	<input type="checkbox"/>
	↑ High ▾	<input type="checkbox"/>
<input type="button" value="Add"/>		

Prioritization for Custom Applications

Click the **Add** button to define a custom application. Click the button  in the **Action** column to delete the custom application in the corresponding row.

When **Supported Applications** is selected, the Pepwave router will inspect network traffic and prioritize the selected applications. Alternatively, you can select **Custom Applications** and define the application by providing the protocol, scope, port number, and DSCP value.

DSL/Cable Optimization

DSL/cable-based WAN connections have lower upload bandwidth and higher download bandwidth. When a DSL/cable circuit's uplink is congested, the download bandwidth will be affected. Users will not be able to download data at full speed until the uplink becomes less congested. **DSL/Cable Optimization** can relieve such an issue. When it is enabled, the download speed will become less affected by the upload traffic. By default, this feature is enabled.

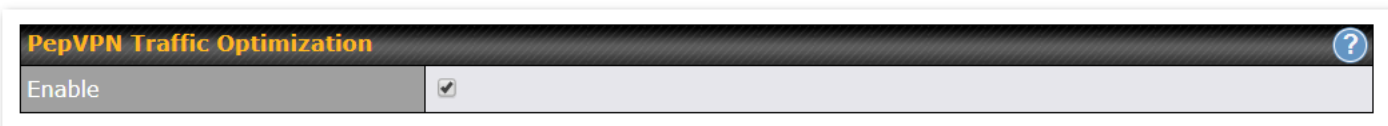

DSL/Cable Optimization

Enable

PepVPN Traffic Optimization

Enable this option to grant PepVPN traffic the highest priority when WAN is congested.

PepVPN Traffic Optimization

Enable

Firewall

A firewall is a mechanism that selectively filters data traffic between the WAN side (the Internet) and the LAN side of the network. It can protect the local network from potential hacker attacks, access to offensive websites, and/or other inappropriate uses.

The firewall functionality of Pepwave routers supports the selective filtering of data traffic in both directions:

- Outbound (LAN to WAN)
- Inbound (WAN to LAN)
- Internal Network (VLAN to VLAN)

The firewall also supports the following functionality:

- Intrusion detection and DoS prevention
- Web blocking

Inbound / Outbound / Internal Network Firewall Settings	
Rule Name	This setting specifies a name for the firewall rule.
Enable	<p>This setting specifies whether the firewall rule should take effect. If the box is checked, the firewall rule takes effect. If the traffic matches the specified protocol/IP/port, actions will be taken by the Pepwave router based on the other parameters of the rule. If the box is not checked, the firewall rule does not take effect. The Pepwave router will disregard the other parameters of the rule.</p> <p>Click the dropdown menu next to the checkbox to place this firewall rule on a time schedule.</p>
WAN Connection (Inbound)	Select the WAN connection that this firewall rule should apply to.
Protocol	<p>This setting specifies the protocol to be matched. Via a drop-down menu, the following protocols can be specified:</p> <ul style="list-style-type: none"> • Any • TCP • UDP • ICMP • DSCP • IP <p>Alternatively, the Protocol Selection Tool drop-down menu can be used to automatically fill in the protocol and port number of common Internet services (e.g., HTTP, HTTPS, etc.)</p> <p>After selecting an item from the Protocol Selection Tool drop-down menu, the protocol and port number</p>

remains manually modifiable.

Source IP & Port This specifies the source IP address(es) and port number(s) to be matched for the firewall rule. A single address, Network, MAC Address or Grouped Network can be specified as the **Source** setting.

Destination IP & Port This specifies the destination IP address(es) and port number(s) to be matched for the firewall rule. A single address, Network, MAC Address or a Grouped Network, can be specified as the **Destination** setting.

Action This option allows you to define whether to allow or deny an IP session matching this Firewall Rule

Event Logging This setting specifies whether or not to log matched firewall events. The logged messages are shown on the page **Status>Event Log**. A sample message is as follows:

Aug 13 23:47:44 Denied CONN=Ethernet WAN SRC=20.3.2.1
DST=192.168.1.20 LEN=48 PROTO=TCP SPT=2260 DPT=80

- **CONN:** The connection where the log entry refers to
- **SRC:** Source IP address
- **DST:** Destination IP address
- **LEN:** Packet length
- **PROTO:** Protocol
- **SPT:** Source port
- **DPT:** Destination port

Click **Save** to store your changes. To create an additional firewall rule, click the **Add Rule** and repeat the above steps. To change a rule's priority, simply drag and drop the rule:

- Hold the left mouse button on the rule.
- Move it to the desired position.
- Drop it by releasing the mouse button.

Outbound Firewall Rules (Drag and drop rows to change rule order)

Rule	Protocol	Source IP Port	Destination IP Port	Policy	
No web access	TCP	Any Any	Any 80	Deny	
No FTP access		Any Any	Any 21	Deny	
Default	Any	Any	Any	Allow	

Add Rule

To remove a rule, click the button.

Rules are matched from top to bottom. If a connection matches any one of the upper rules, the matching process will stop. If none of the rules match, the Default rule will be applied. By default, the **Default** rule is set as **Allow** for Outbound, Inbound and Internal Network access.

Tip

If the default inbound rule is set to **Allow** for NAT-enabled WANs, no inbound Allow firewall rules will be required for inbound port forwarding and inbound NAT mapping rules. However, if the default inbound rule is set as **Deny**, a corresponding Allow firewall rule will be required.

Intrusion Detection and DoS Prevention

Pepwave routers can detect and prevent intrusions and denial-of-service (DoS) attacks from the Internet. To turn on this feature, click , check the **Enable** check box, and press the **Save** button.

When this feature is enabled, the Pepwave router will detect and prevent the following kinds of intrusions and denial-of-service attacks.

- Port scan
 - NMAP FIN/URG/PSH
 - Xmas tree
 - Another Xmas tree
 - Null scan
 - SYN/RST
 - SYN/FIN
- SYN flood prevention
- Ping flood attack prevention

URL Logging

Enable

Log Server Host Port: 514

Application Blocking

Choose applications to be blocked from LAN/PPTP/PepVPN peer clients' access, except for those on the Exempted Subnets defined in that particular section on the same page.

Web Blocking

Defines website domain names to be blocked from LAN/PPTP/PepVPN peer clients' access except for those on the Exempted Subnets defined in that particular section on the same page.

If "foobar.com" is entered, any web site with a host name ending in foobar.com will be blocked, e.g. www.foobar.com, foobar.com, etc. However, "myfoobar.com" will not be blocked.

You may enter the wild card ".*" at the end of a domain name to block any web site with a host name having the domain name in the middle. If you enter "foobar.*", then "www.foobar.com", "www.foobar.co.jp", or "foobar.co.uk" will be blocked. Placing the wild card in any other position is not supported.

The device will inspect and look for blocked domain names on all HTTP and HTTPS traffic.

Exempted Subnets

With the subnet defined in the field, clients on the particular subnet(s) will be exempted from the Web blocking rules.

URL Logging

Click **enable**, and enter the ip address and port (if applicable) where your remote syslog server is located.

Routing Protocols

The Pepwave Surf SOHO supports OSPF ,RIPv2 and BGP dynamic routing protocols.

OSPF & RIPv2

Click the **Advanced** tab from the top bar, and then click the **Routing Protocols > OSPF & RIPv2** item on the sidebar to reach the following menu.

OSPF		
Router ID	LAN IP Address	
Area	Interfaces	
0.0.0.0	No interface is selected	
Add		

RIPv2	
No RIPv2 Defined.	

OSPF & RIPv2 Route Advertisement			
PepVPN Route Isolation		<input type="checkbox"/> Enable	
Network Advertising		---	
All LAN/VLAN networks will be advertised when no network advertising is chosen.			
Static Route Advertising		<input checked="" type="checkbox"/> Enable	
	Excluded Networks	Subnet Mask	
		255.255.255.0 (/24)	
Save			

OSPF	
Router ID	This field determines the ID of the router. By default, this is specified as the LAN IP address. If you want to specify your own ID, enter it in the Custom field.
Area	This is an overview of the OSPFv2 areas you have defined. Click on the area name to configure it. To set a new area, click Add . To delete an existing area, click .

OSPF settings ✕

Help Close
 Click [here](#) to customize interface cost

OSPF Settings	
Area ID	Determine the name of your Area ID to apply to this group. Machines linked to this group will send and receive related OSPF packets, while unlinked machines will ignore it.
Link Type	Choose the network type that this area will use.
Authentication	Choose an authentication method, if one is used, from this drop-down menu. Available options are MD5 and Text . Enter the authentication key next to the drop-down menu.
Interfaces	Determine which interfaces this area will use to listen to and deliver OSPF packets
Interface Cost	Enable the advanced option (question mark) to be able to configure a custom cost for each interface.

To access RIPv2 settings, click .

RIPv2 settings ✕

Authentication	None ▾
Interfaces	<input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/>

RIPv2 Settings	
Authentication	Choose an authentication method, if one is used, from this drop-down menu. Available options are MD5 and Text . Enter the authentication key next to the drop-down menu.
Interfaces	Determine which interfaces this group will use to listen to and deliver RIPv2 packets.

OSPF & RIPv2 Route Advertisement	
PepVPN Route Isolation	<input type="checkbox"/> Enable
Network Advertising	<div style="border: 1px solid #ccc; padding: 2px;"> <input type="text" value="---"/> </div> <input type="button" value="+"/> <p style="font-size: small; margin-top: 0;">All LAN/VLAN networks will be advertised when no network advertising is chosen.</p>
Static Route Advertising	<input type="checkbox"/> Enable
<input type="button" value="Save"/>	

OSPF & RIPv2 Route Advertisement	
PepVPN Route Isolation	<p>Enable this option if you want to isolate PepVPN peers from each other. Received PepVPN routes will not be forwarded to other PepVPN peers to reduce bandwidth consumption.</p> <p>Note: This will only hide routing information between PepVPN peers, if you want to fully block inter-PepVPN traffics, you should configure Firewall rules instead.</p>
Network Advertising	<p>Selected networks will be advertised over OSPF & RIPv2. If no network is selected, all LAN / VLAN networks will be advertised by default.</p> <p>All the networks belonging to interfaces that have OSPF or RIPv2 enabled will be advertised even if they are not selected in this table.</p>
Static Route Advertising	<p>Enable this option to advertise LAN static routes over OSPF & RIPv2. Static routes that match the Excluded Networks table will not be advertised.</p>

BGP

BGP (Border Gateway Protocol) is a protocol that manages how packets are routed across the internet through the exchange of routing and reachability information between edge routers. BGP directs packets between autonomous systems (AS) -- networks managed by a single enterprise or service provider.

Click the Network tab from the top bar, and then click the **BGP** item on the sidebar to configure BGP.

BGP	AS	Neighbors
No BGP Profile Defined.		
<input type="button" value="Add"/>		

Click "x" to delete a BGP profile

Click "Add" to add a new BGP profile

BGP Profile						
Profile Name	<input type="text"/>

BGP Profile

Name	This field is for specifying a name to represent this profile.
Enable	When this box is checked, this BGP profile will be enabled. If it is left unchecked, it will be disabled.
Interface	The interface in which the BGP neighbor is located.
Autonomous System	The Autonomous System Number (ASN) assigned to this profile.
Neighbor	BGP Neighbors and their details.
IP address	The IP address of the Neighbor.
Autonomous	The Neighbor's ASN.

System	
Multihop/TTL	This field determines the Time-to-live (TTL) of BGP packets. Leave this field blank if the BGP neighbor is directly connected, otherwise you must specify a TTL value. This option should be used if the configured Neighbor's IP address does not match the selected Interface's network subnets. The TTL value must be between 2 to 255.
Password	(Optional) Assign a password for MD5 authentication of BGP sessions.
AS-Path Prepending:	AS path to be prepended to the routes received from this Neighbor. Values must be ASN and separated by commas. For example: inputting "64530,64531" will prepend "64530, 64531" to received routes.
Hold Time	Wait time in seconds for a keepalive message from a Neighbor before considering the BGP connection as stalled. The value must be either 0 (infinite hold time) or between 3 and 65535 inclusively. Default: 240
Next Hop Self	Enable this option to advertise your own source address as the next hop when propagating routes.
iBGP Local Preference	This is the metric advertised to iBGP Neighbors to indicate the preference for external routes. The value must be between 0 to 4294967295 inclusively. Default: 100
BFD	Enable this option to add Bidirectional Forwarding Detection for path failure. All directly connected Neighbors that use the same physical interface share the same BFD settings. All multihop Neighbors share the same multihop BFD settings. You can configure BFD settings in the BGP profile listing page after this option is enabled.

Route Advertisement

			+

Filter Mode

This field allows for the selection of the filter mode for route import.

None: All BGP routes will be accepted.
Accept: Routes in "Restricted Networks" will be accepted, routes not in the list will be rejected.
Reject: Routes in "Restricted Networks" will be rejected, routes not in the list will be accepted.

Restricted / Blocked Networks

This field specifies the network(s) in the "route import" entry.

Exact Match: When this box is checked, only routes with the same Network and Subnet Mask will be filtered. Otherwise, routes within the Networks and Subnets will be filtered.

Route Export

Filter Mode	? Accept ▼		
Restricted Networks	Network	Subnet Mask	Exact Match
		255.255.255.0 (/24) ▼	<input type="checkbox"/>
Export to other BGP Profile	? <input type="checkbox"/>		
Export to OSPF	? <input type="checkbox"/>		

Filter Mode

This field allows for the selection of the filter mode for route export.

None: All BGP routes will be accepted.
Accept: Routes in "Restricted Networks" will be accepted, routes not in the list will be rejected.

	Reject: Routes in "Restricted Networks" will be rejected, routes not in the list will be accepted.
Restricted / Blocked Networks	This field specifies the network(s) in the "route export" entry. Exact Match: When this box is checked, only routes with the same Network and Subnet Mask will be filtered. Otherwise, routes within the Networks and Subnets will be filtered.
Export to other BGP Profile	When this box is checked, routes learnt from this BGP profile will be exported to other BGP profiles.
Export to OSPF	When this box is checked, routes learnt from this BGP profile will be exported to the OSPF routing protocol.

Remote User Access

A remote-access VPN connection allows an individual user to connect to a private business network from a remote location using a laptop or desktop computer connected to the Internet. Networks routed by a Peplink router can be remotely accessed via OpenVPN, L2TP with IPsec or PPTP. To configure this feature, navigate to **Network > Remote User Access** and choose the required VPN type.

L2TP with IPsec

Remote User Access Settings	
Enable	<input checked="" type="checkbox"/>
VPN Type	<input checked="" type="radio"/> L2TP with IPsec <input type="radio"/> PPTP <input type="radio"/> OpenVPN
Preshared Key	<input type="text"/> <input checked="" type="checkbox"/> Hide Characters

L2TP with IPsec Remote User Access Settings	
Pre-shared Key	Enter your pre shared key in the text field. Please note that remote devices will need this preshared key to access the Balance.
Listen On	This setting is for specifying the WAN IP addresses that allow remote user access.
Disable Weak Ciphers	Click the button to show and enable this option. When checked, weak ciphers such as 3DES will be disabled.

Continue to configure the authentication method.

OpenVPN

Remote User Access Settings	
Enable	<input checked="" type="checkbox"/>
VPN Type	<input type="radio"/> L2TP with IPsec <input type="radio"/> PPTP <input checked="" type="radio"/> OpenVPN You can obtain the OpenVPN client profile from the status page .

Select OpenVPN and continue to configure the authentication method.

The OpenVPN Client profile can be downloaded from the **Status > device** page after the configuration has been saved.

OpenVPN Client Profile	Route all traffic Split tunnel
------------------------	------------------------------------------------------------------

You have a choice between 2 different OpenVPN Client profiles.

- **"route all traffic" profile** :Using this profile, VPN clients will send all the traffic through the OpenVPN tunnel
- **"split tunnel" profile**: Using this profile, VPN clients will ONLY send those traffic designated to the untagged LAN and VLAN segment through the OpenVPN tunnel.

PPTP

Remote User Access Settings	
Enable	<input checked="" type="checkbox"/>
VPN Type	<input type="radio"/> L2TP with IPsec <input checked="" type="radio"/> PPTP <input type="radio"/> OpenVPN

No additional configuration required.

The Point-to-Point Tunneling Protocol (PPTP) is an obsolete method for implementing virtual private networks. PPTP has many well known security issues

Continue to configure authentication methods.

SMTP Forwarding

Some ISPs require their users to send emails via the ISP's SMTP server. All outgoing SMTP connections are blocked except those connecting to the ISP's. Pepwave routers support intercepting and redirecting all outgoing SMTP connections (destined for TCP port 25) via a WAN connection to the WAN's corresponding SMTP server.

SMTP Forwarding Setup ?

SMTP Forwarding Enable

Connection	Enable Forwarding?	SMTP Server	SMTP Port
WAN 1	<input type="checkbox"/>	<input type="text"/>	<input type="text"/>
WAN 2	<input type="checkbox"/>	<input type="text"/>	<input type="text"/>
Wi-Fi WAN	<input type="checkbox"/>	<input type="text"/>	<input type="text"/>
Cellular 1	<input type="checkbox"/>	<input type="text"/>	<input type="text"/>
Cellular 2	<input type="checkbox"/>	<input type="text"/>	<input type="text"/>
USB	<input type="checkbox"/>	<input type="text"/>	<input type="text"/>

To enable the feature, select **Enable** under **SMTP Forwarding Setup**. Check **Enable Forwarding** for the WAN connection(s) that needs forwarding. Under **SMTP Server**, enter the ISP's email server hostname or IP address. Under **SMTP Port**, enter the TCP port number for each WAN.

The Pepwave router will intercept SMTP connections. Choose a WAN port according to the outbound policy, and then forward the connection to the SMTP server if the chosen WAN has enabled forwarding. If the forwarding is disabled for a WAN connection, SMTP connections for the WAN will be simply be forwarded to the connection's original destination.

Web Proxy Forwarding

Web Proxy Forwarding Setup ?

Web Proxy Forwarding Enable

Web Proxy Interception Settings

Proxy Server IP Address Port
(Current settings in users' browser)

Connection	Enable Forwarding?	Proxy Server IP Address : Port
WAN 1	<input type="checkbox"/>	<input type="text"/> : <input type="text"/>
WAN 2	<input type="checkbox"/>	<input type="text"/> : <input type="text"/>
Wi-Fi WAN	<input type="checkbox"/>	<input type="text"/> : <input type="text"/>
Cellular 1	<input type="checkbox"/>	<input type="text"/> : <input type="text"/>
Cellular 2	<input type="checkbox"/>	<input type="text"/> : <input type="text"/>
USB	<input type="checkbox"/>	<input type="text"/> : <input type="text"/>

When this feature is enabled, the Pepwave router will intercept all outgoing connections destined for the proxy server specified in **Web Proxy Interception Settings**, choose a WAN connection with reference to the outbound policy, and then forward them to the specified web proxy server and port number. Redirected server settings for each WAN can be set here. If forwarding is disabled for a WAN, web proxy connections for the WAN will be simply forwarded to the connection's original destination.

DNS Forwarding

DNS Forwarding Setup ?

Forward Outgoing DNS Requests to Local DNS Proxy	<input type="checkbox"/> Enable
--------------------------------------------------	---------------------------------

When DNS forwarding is enabled, all clients' outgoing DNS requests will also be intercepted and forwarded to the built-in DNS proxy server.

Custom Service Forwarding

Custom Service Forwarding Setup

Custom Service Forwarding	<input checked="" type="checkbox"/> Enable				
Settings	Source Network	TCP Port	Server IP Address	Server Port	+
	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	

After clicking the **enable** checkbox, enter your TCP port for traffic heading to the router, and then specify the IP Address and Port of the server you wish to forward to the service to.

Service Passthrough

Service passthrough settings can be found at **Advanced>Misc. Settings>Service Passthrough**.

Service Passthrough Support ?	
SIP ?	<input type="radio"/> Standard Mode <input checked="" type="radio"/> Compatibility Mode <input checked="" type="checkbox"/> Define custom signal ports 1. <input type="text"/> 2. <input type="text"/> 3. <input type="text"/>
H.323	<input checked="" type="checkbox"/> Enable
FTP ?	<input checked="" type="checkbox"/> Enable <input checked="" type="checkbox"/> Define custom control ports 1. <input type="text"/> 2. <input type="text"/> 3. <input type="text"/>
TFTP	<input type="checkbox"/> Enable
IPsec NAT-T ?	<input checked="" type="checkbox"/> Enable <input checked="" type="checkbox"/> Define custom ports 1. <input type="text"/> 2. <input type="text"/> 3. <input type="text"/> <input checked="" type="checkbox"/> Route IPsec Site-to-Site VPN via <input type="text"/>

(Registered trademarks are copyrighted by their respective owner)

Some Internet services need to be specially handled in a multi-WAN environment. Pepwave routers can handle these services such that Internet applications do not notice being behind a multi-WAN router. Settings for service passthrough support are available here.

Service Passthrough Support	
SIP	Session initiation protocol, aka SIP, is a voice-over-IP protocol. The Pepwave router can act as a SIP application layer gateway (ALG) which binds connections for the same SIP session to the same WAN connection and translate IP address in the SIP packets correctly in NAT mode. Such passthrough support is always enabled, and there are two modes for selection: Standard Mode and Compatibility Mode . If your SIP server's signal port number is non-standard, you can check the box Define custom signal ports and input the port numbers to the text boxes.
H.323	With this option enabled, protocols that provide audio-visual communication sessions will be defined on any packet network and pass through the Pepwave router.
FTP	FTP sessions consist of two TCP connections; one for control and one for data. In a multi-WAN situation, they must be routed to the same WAN connection. Otherwise, problems will arise in transferring files. By default, the Pepwave router monitors TCP control connections on port 21 for any FTP connections and binds TCP connections of the same FTP session to the same WAN. If you have an FTP server listening on a port number other than 21, you can check Define custom control ports and enter the port numbers in the text boxes.
TFTP	The Pepwave router monitors outgoing TFTP connections and routes any incoming TFTP data packets back to the client. Select Enable if you want to enable TFTP passthrough support.
IPsec NAT-T	This field is for enabling the support of IPsec NAT-T passthrough. UDP ports 500, 4500, and 10000 are monitored by default. You may add more custom data ports that your IPsec system uses by checking Define custom ports . If the VPN contains IPsec site-to-site VPN traffic, check Route IPsec Site-to-Site VPN and choose the WAN connection to route the traffic to.

Grouped Networks

Grouped Networks	
Name	Networks
<input type="button" value="Add Group"/>	

Using “Grouped Networks” you can group and name a range of IP addresses, which can then be used to define firewall rules or outbound policies.

Start by clicking on “add group” then fill in the appropriate fields.

In this example we’ll create a group “accounting”

Click save when you have finished adding the required networks.

Grouped Networks			
Name	Accounting		
Networks	Network	Subnet Mask	
	192.168.50.192	255.255.255.224 (/27)	<input type="button" value="X"/>
		255.255.255.255 (/32)	<input type="button" value="+"/>

The grouped network “accounting” can now be used to configure a group policy or firewall rule.

AP

Use the controls on the AP tab to set the wireless SSID and AP settings.

Wireless SSID

Wireless network settings, including the name of the network (SSID) and security policy can be defined and managed in this section.

Click **Add** to create a new network profile, or click the existing network profile to modify its settings.

SSID Settings	
SSID	This setting specifies the Router SSID that Wi-Fi clients will see when scanning.
Enable	Click the drop-down menu to choose predefined schedules as your starting point. Please note that

	upon selection, previous changes on the schedule map will be deleted.
VLAN	Some service providers require the router to enable VLAN tagging for Internet traffic. If it is required by your service provider, you can enable this field and enter the VLAN ID that the provider requires.
Broadcast SSID	This setting specifies whether or not Wi-Fi clients can scan the SSID of this wireless network. Broadcast SSID is enabled by default.
Data Rate	Select Auto to allow your access point to set the data rate automatically, or select Fixed and choose a rate from the drop-down menu. Click the MCS Index link to display a reference table containing MCS and matching HT20 and HT40 values.
Multicast Filter	This setting enables the filtering of multicast network traffic to the wireless SSID.
Multicast Rate	This setting specifies the transmit rate to be used for sending multicast network traffic.
IGMP Snooping	To allow your access point to convert multicast traffic to unicast traffic for associated clients, select this option.
Layer 2 Isolation	<p>Layer 2 refers to the second layer in the ISO Open System Interconnect model.</p> <p>When this option is enabled, it will block communication between Wi-Fi clients within the same VLAN, SSID or subnet, as a security measure that best suits a company Guest/Visitor Wi-Fi access scenario.</p> <p>Do refer to this link https://forum.peplink.com/t/lan-isolation-with-balance30-and-ap-one-ac-mini-help-needed/3914/4 for visual illustration of the feature. By default, the setting is disabled.</p>
Maximum number of Clients	Enter the maximum number of clients that can simultaneously connect to your SSID, or enter 0 to allow unlimited Wi-Fi clients.
Band Steering	<p>To reduce 2.4 GHz band overcrowding, AP with band steering steers clients capable of 5 GHz operation to 5 GHz frequency.</p> <p>Force - Clients capable of 5 GHz operation are only offered with 5 GHz frequency.</p> <p>Prefer - Clients capable of 5 GHz operation are encouraged to associate with 5 GHz frequency. If the clients insist to attempt on 2.4 GHz frequency, 2.4 GHz frequency will be offered.</p> <p>Default: Disable</p>

Security Settings	
Security Policy	WPA2 - Personal ▼
Encryption	AES:CCMP
Shared Key ?	<input type="text"/> <input checked="" type="checkbox"/> Hide Characters
Management Frame Protection	Default (Disabled) ▼

Security Settings	
Security Policy	WPA2 - Enterprise ▼
Encryption	AES:CCMP
802.1X Version	<input checked="" type="radio"/> V1 <input type="radio"/> V2
Management Frame Protection	Default (Disabled) ▼
Fast Transition ?	<input type="checkbox"/>

Security Settings

Security Policy

This setting configures the wireless authentication and encryption methods. Available options: :

- Open (No Encryption)
- WPA3 -Personal (AES:CCMP)
- WPA2/WPA3 -Personal (AES:CCMP)
- WPA2 -Personal (AES:CCMP)
- WPA2 – Enterprise
- WPA/WPA2 - Personal (TKIP/AES: CCMP)
- WPA/WPA2 – Enterprise

When WPA/WPA2 - Enterprise is selected, RADIUS-based 802.1 x authentication is enabled. Under this configuration, the Shared Key option does not apply and is therefore hidden. When using this method, select the appropriate version using the V1/V2 controls. The security level of this method is known to be very high.

When WPA/WPA2 - Personal is selected, a shared key is used for data encryption and authentication. When using this configuration, the Shared Key option should be enabled. Key length must be between eight and 63 characters (inclusive). The security level of this method is known to be high.

NOTE:

When WPA2/WPA3- Personal is configured, if a managed AP which is NOT WPA3 PSK capable, the AP Controller will not push those WPA3 and WPA2/WPA3 SSID to that AP.

Management Frame Protection

This feature protects stations against forged management frames spoofed from other devices. Frames that are protected include Disassociation, Deauthentication and QoS Action.

Fast Transition

When WPA2/WPA3 - (Personal / Enterprise) is selected, the Fast Transition option is the standard defined for 801.11r to reduce the association process when it roams from one Access Point to

another Access Point.

Access Control Settings	
Restricted Mode	Deny all except listed ▼
MAC Address List ?	<input type="text"/>

Access Control

Restricted Mode The settings allow administrators to control access using Mac address filtering. Available options are **None**, **Deny all except listed**, **Accept all except** and **RADIUS MAC Authentication**.

MAC Address List Connections originating from the MAC addresses in this list will be either denied or accepted based on the option selected in the previous field.

RADIUS Settings	Primary Server	Secondary Server
	You may click here to define RADIUS Server Authentication profile, or you may go to RADIUS Server page to define multiple profiles	
Authentication Host	<input type="text"/>	<input type="text"/>

NAS-Identifier	<input type="text" value="Device Name"/> ▼	

RADIUS Server

Host Specifies the IP address or hostname of the RADIUS server host.

Secret This field is for entering the secret key for communicating to the RADIUS server.

Authentication Port This setting specifies the UDP destination port for authentication requests. By default, the port

number is 1812.

Accounting Port This setting specifies the UDP destination port for accounting requests. By default, the port number is 1813.

NAS-Identifier The setting allows administrators to identify the client to the RADIUS server. Available options are **Device Name**, **LAN Mac Address**, **Device Serial Number** and **Custom Value**.

The screenshot shows the 'Firewall Settings' configuration page. The 'Firewall Mode' dropdown menu is open, displaying four options: 'Lockdown - Block all except...', 'Disable', 'Flexible - Allow all except...', and 'Lockdown - Block all except...'. The 'New Rule' button is visible at the bottom right of the settings area.

Firewall Settings

Firewall Mode The settings allow administrator to control access to the SSID based on Firewall Rules. Available options are **Disable**, **Lockdown - Block all except...** and **Flexible -Allow all except...**

Firewall Exceptions Create Firewall Rules based on **Port**, **IP Network**, **MAC address** or **Domain Name**

Settings

Navigating to **AP>Settings** displays a screen similar to the one shown below:

Wi-Fi Radio Settings

Operating Country This option sets the country whose regulations the Pepwave router follows.

SSID Select if an SSID is broadcasting on 2.4 Ghz, 5 Ghz or both bands

Wi-Fi AP Settings

Protocol	This option allows you to specify which client association requests will be accepted. By default, 802.11ng is selected.
Channel Width	Settings for 2.4 GHz AP and 5GHz AP can be configured here: 2.4 GHz: 40 MHz, 20/40 MHz and 20 MHz are available. The default setting is 20/40 MHz , which allows both widths to be used simultaneously. 80 MHz , 40 Mhz, 20 Mhz, and(20/40 MH) are available. The default setting is 80 MHz . Note: 802.11ng and 802.11na are not part of the 802.11 standard. It is simply a notation for indicating 802.11n use on the 2.4-GHz band (11ng) or 802.11n use on the 5-GHz band (11na).
Channel	This option allows you to select which 802.11 RF channel will be used.
Auto Channel Update	Indicate the time of day for updating the automatic channel selection.
Output Power	This option is for specifying the transmission output power for the Wi-Fi AP. There are 4 relative power levels available – Max, High, Mid, and Low . The actual output power will be bound by the regulatory limits of the selected country.
Client Signal Strength Threshold^A	This field determines that maximum signal strength each individual client will receive. The measurement unit is dBm.
Maximum number of clients	Enter the maximum number of clients that can simultaneously connect to the wireless network or enter 0 to allow an unlimited number of connections.
Beacon Rate^A	This option is for setting the transmit bit rate for sending a beacon. By default, 1Mbps is selected.
Beacon Interval^A	This option is for setting the time interval between each beacon. By default, 100ms is selected.
DTIM^A	This field allows you to set the frequency for the beacon to include a delivery traffic indication message. The interval is measured in milliseconds. The default value is set to 1 ms .
RTS Threshold	Set the minimum packet size for your access point to send an RTS using the RTS/CTS handshake. Setting 0 disables this feature.
Fragmentation Threshold^A	Determines the maximum size (in bytes) that each packet fragment will be broken down into. Set 0 to disable fragmentation.

Distance/Time Converter^A	Select the distance you want your Wi-Fi to cover in order to adjust the below parameters. Default values are recommended.
Slot Time^A	This field is for specifying the wait time before the Surf SOHO transmits a packet. By default, this field is set to 9 μs .
ACK Timeout^A	This field is for setting the wait time to receive an acknowledgement packet before performing a retransmission. By default, this field is set to 48 μs .
Frame Aggregation^A	This option allows you to enable frame aggregation to increase transmission throughput.

^A - Advanced feature. Click the button on the top right-hand corner to activate.

AP > Status

Access Point

A detailed breakdown of data usage for each AP is available at **AP > Access Point**.

AP Status	
Name	IP Address
[Redacted]	(Local)

Access Point

AP Name/Serial Number

This field allows you to quickly find your device if you know its name or serial number. Fill in the field to begin searching. Partial names and serial numbers are supported.

This table shows the detailed information of each AP, including channel, number of clients, upload traffic, and download traffic. On the right-hand side of the table, you will see the following icons:

Clicking on the icon displays a table with a list of clients and their usage.

Client List

AP Status

Clicking on the icon allows you to configure the AP device's details.

AP Details		
Serial Number	<input type="text"/>	
MAC Address	A8:C0:EA:05:FC:80	
Product Name	Pepwave Surf SOHO MK3	
Firmware Version	8.1.3 build 5030	
SSID List	2.4 GHz: PEPWAVE_ (A8:C0:EA:05:FC:85) PEPWAVE_ (A8:C0:EA:05:FC:85) 5 GHz: PEPWAVE_ (A8:C0:EA:05:FC:89) PEPWAVE_ (A8:C0:EA:05:FC:89)	
Current Channel	2.4 GHz: 6 5 GHz: 36	
Current Output Power	2.4 GHz: 20 dBm 5 GHz: 18 dBm	

For easier network management, you can give each client a name and designate its location. You can also designate which firmware pack (if any) that this client will follow, as well as the channels that the client will broadcast on.

Clicking on the  icon displays usage in the form of graphs.

Click on any point in the graphs to display detailed usage and client information for that device, using that SSID, at that point in time. On the **Data Usage by** menu, you can display the information by SSID or by AP send/receive rate.

Click the **Event** tab next to **Wireless Usage** to view a detailed event log for that particular device.

The screenshot shows a window titled 'Event' with two tabs: 'Wireless Usage' and 'Event'. The 'Event' tab is selected. Below the tabs, there is a table titled 'Event Log' with a blue 'Auto refresh' checkbox. The table contains the following data:

Timestamp	Event Description	Frequency
Aug 18 13:54:41	Client LAPTOP-TIRBRFPU (C8:B2:9B:63:C2:CA) associated with [redacted] (2.4 GHz)	2.4 GHz
Aug 18 13:54:41	Client LAPTOP-TIRBRFPU (C8:B2:9B:63:C2:CA) disassociated from [redacted] (2.4 GHz)	2.4 GHz

		More...

Events

This event log displays all of the activity on your AP network, down to the client level. Use a filter to search for events by MAC address, SSID, AP Serial Number, or AP Profile name. Click **View Alerts** to see only alerts, and click the **More...** for additional records.

System Settings

The options on the System tab control login and security settings, firmware upgrades, SNMP settings, and other settings.

Admin Security

The **Admin Security** section allows you to set up your access point's name, password, security settings, and other options

Admin Settings	
Device Name	This field allows you to define a name for this Pepwave router. By default, Router Name is set as surf-soho-XXXX , where XXXX refers to the last 4 digits of the unit's serial number.
Admin User Name	Admin User Name is set as <i>admin</i> by default, but can be changed, if desired.
Admin Password	This field allows you to specify a new administrator password.
Confirm Admin Password	This field allows you to verify and confirm the new administrator password.
Read-only User Name	Read-only User Name is set as <i>user</i> by default, but can be changed, if desired.
User Password	This field allows you to specify a new user password. Once the user password is set, the read-only user feature will be enabled.
Confirm User Password	This field allows you to verify and confirm the new user password.

Web Session Timeout

This field specifies the number of hours and minutes that a web session can remain idle before the Pepwave router terminates its access to the web admin interface. By default, it is set to **4 hours**.

With this external authentication is selected, the web admin will authenticate using the corresponding external server. Authenticated users are treated as either "admin" with full read-write permission or "user" with read-only access. Local admin and user accounts will be disabled. However, when the device is not able to communicate with the external server, local accounts are enabled to allow emergency access. By default, it is set to Local Account.

Available options:

- Local Account
- RADIUS

Authentication Method	<input type="radio"/> Local Account <input checked="" type="radio"/> RADIUS <input type="radio"/> TACACS+
Authentication Protocol	MS-CHAP v2 ▼
	You may click here to define RADIUS Server Authentication profile, or you may go to RADIUS Server page to define multiple profiles
Authentication Host	<input type="text"/>
Authentication Port	1812
Authentication Secret	<input type="text"/> <input checked="" type="checkbox"/> Hide Characters
	You may click here to define RADIUS Server Accounting profile, or you may go to RADIUS Server page to define multiple profiles
Accounting Host	<input type="text"/>
Accounting Port	1813
Accounting Secret	<input type="text"/> <input checked="" type="checkbox"/> Hide Characters
Authentication Timeout	3 seconds

Authentication Method

Authentication Protocol	This specifies the authentication protocol used. Available options are MS-CHAP v2 and PAP .
Authentication Host	This specifies the IP address or hostname of the RADIUS server host.
Authentication Port	This setting specifies the UDP destination port for authentication requests.
Authentication Secret	This field is for entering the secret key for accessing the RADIUS server.
Accounting Host	This specifies the IP address or hostname of the RADIUS server host.
Accounting Port	This setting specifies the UDP destination port for accounting requests.
Accounting Secret	This field is for entering the secret key for accessing the accounting server.
Authentication Timeout	This option specifies the time value for authentication timeout

- TACACS+

Authentication Method	<input type="radio"/> Local Account <input type="radio"/> RADIUS <input checked="" type="radio"/> TACACS+
TACACS+ Server	<input type="text"/>
TACACS+ Server Secret	<input type="text"/> <input checked="" type="checkbox"/> Hide Characters
TACACS+ Server Timeout	<input type="text" value="3"/> seconds

TACACS+ Server	This specifies the access address of the external TACACS+ server.
TACACS+ Server Secret	This field is for entering the secret key for accessing the RADIUS server.
TACACS+ Server Timeout	This option specifies the time value for TACACS+ timeout

CLI SSH & Console	The CLI (command line interface) can be accessed via SSH. This field enables CLI support. For additional information regarding CLI, please refer to Section 30.5 .
CLI SSH Access	This menu allows you to choose between granting access to LAN and WAN clients, or to LAN clients only.
CLI SSH Port	This field determines the port on which clients can access CLI SSH.
Security	<p>This option is for specifying the protocol(s) through which the web admin interface can be accessed:</p> <ul style="list-style-type: none"> • HTTP • HTTPS • HTTP/HTTPS <p>HTTP to HTTPS redirection is enabled by default to force HTTPS access to the web admin interface.</p>
Web Admin Access	<p>This option is for specifying the network interfaces through which the web admin interface can be accessed:</p> <ul style="list-style-type: none"> • LAN only • LAN/WAN <p>If LAN/WAN is chosen, the WAN Connection Access Settings form will be displayed.</p>
Web Admin Port	This field is for specifying the port number on which the web admin interface can be accessed.

Firmware

Upgrading firmware can be done in one of three ways.

Using the router's interface to automatically check for an update, using the router's interface to manually upgrade the firmware, or using InControl2 to push an upgrade to a router.

The automatic upgrade can be done from **System > Firmware**.

If an update is found the buttons will change to allow you to **Download and Update** the firmware.

Click on the **Download and Upgrade** button. A prompt will be displayed advising to download the Current Active Configuration. Please click on the underlined download text. After downloading the current config click the **Ok** button to start the upgrade process.

The router will download and then apply the firmware. The time that this process takes will depend on your internet connection's speed.

The firmware will now be applied to the router*. The amount of time it takes for the firmware to upgrade will also depend on the router that's being upgraded.

Firmware Upgrade

It may take up to 8 minutes.

***Upgrading the firmware will cause the router to reboot.**

Web admin interface : install updates manually

In some cases, a special build may be provided via a ticket or it may be found in the forum. Upgrading to the special build can be done using this method, or using IC2 if you are using that to manage your firmware upgrades. A manual upgrade using the GA firmware posted on the site may also be recommended or required for a couple of reasons.

All of the Peplink/Pepwave GA firmware can be found [here](#) Navigate to the relevant product line (ie. Balance, Max, FusionHub, SOHO, etc). Some product lines may have a dropdown that lists all of the products in that product line. Here

is a screenshot from the Balance line.

Balance

Product

Search:

Product	Hardware Revision	Firmware Version	Download Link	Release Notes	User Manual
Balance 1350	HW2	7.1.2	Download	PDF	PDF
Balance 1350	HW1	6.3.4	Download	PDF	PDF
Balance 20	HW1-6	7.1.2	Download	PDF	PDF
Balance 210	HW4	7.1.2	Download	PDF	PDF

If the device has more than one firmware version the current hardware revision will be required to know what firmware to download.

Navigate to System > Firmware and click the Choose File button under the Manual Firmware Upgrade section. Navigate to the location that the firmware was downloaded to select the “.img” file and click the Open button.

Click on the Manual Upgrade button to start the upgrade process.

Manual Firmware Upgrade ?

Firmware Image No file chosen

A prompt will be displayed advising to download the Current Active Configuration. Please click on the underlined download text. After downloading the current config click the Ok button to start the upgrade process. The firmware will now be applied to the router*. The amount of time it takes for the firmware to upgrade will depend on the router that's being upgraded.

***Upgrading the firmware will cause the router to reboot.**

The InControl method

[Described in this knowledgebase article on our forum.](#)

Time

Time Settings enables the system clock of the Pepwave router to be synchronized with a specified time server. Time settings are located at **System>Time**.

Time Settings	
Time Zone	(GMT) Greenwich Mean Time : Dublin, Edinburgh, Lisbon, Lon ▾ <input type="checkbox"/> Show all
Time Server	0.pepwave.pool.ntp.org Default

Save

Time Settings	
Time Zone	This specifies the time zone (along with the corresponding Daylight Savings Time scheme). The Time Zone value affects the time stamps in the Pepwave router's event log and e-mail notifications. Check Show all to show all time zone options.
Time Server	This setting specifies the NTP network time server to be utilized by the Pepwave router.

Schedule

Enable and disable different functions (such as WAN connections, outbound policy, and firewalls at different times, based on a user-scheduled configuration profile. The settings for this are located at **System > Schedule**

Name	Time	Used by
No schedule profile defined		
New Schedule		

Enable scheduling, and then click on your schedule name or on the **New Schedule** button to begin.

✕

Edit schedule profile

Schedule Settings

Enable	<input checked="" type="checkbox"/> <p style="font-size: 0.8em; margin: 0;">The schedule function of those associated features will be lost if profile is disabled.</p>

Edit Schedule Profile	
Enabling	Click this checkbox to enable this schedule profile. Note that if this is disabled, then any associated features will also have their scheduling disabled.
Name	Enter your desired name for this particular schedule profile.
Schedule	Click the drop-down menu to choose pre-defined schedules as your starting point. Please note that upon selection, previous changes on the schedule map will be deleted.
Schedule Map	Click on the desired times to enable features at that time period. You can hold your mouse for faster entry.

Email Notification

Email notification functionality provides a system administrator with up-to-date information on network status. The settings for configuring email notifications are found at **System>Email Notification**.

Email Notification Setup ?	
Email Notification	<input checked="" type="checkbox"/> Enable
SMTP Server	smtp.mycompany.com <input checked="" type="checkbox"/> Require authentication
Connection Security	None ▾
SMTP Port	25
SMTP User Name	smtouser
SMTP Password	••••
Confirm SMTP Password	••••
Sender's Email Address	admin@mycompany.com
Recipient's Email Address	system@mycompany.com staff@mycompany.com 

Email Notification Settings

Email Notification	This setting specifies whether or not to enable email notification. If Enable is checked, the Pepwave router will send email messages to system administrators when the WAN status changes or when new firmware is available. If Enable is not checked, email notification is disabled and the Pepwave router will not send email messages.
SMTP Server	This setting specifies the SMTP server to be used for sending email. If the server requires authentication, check Require authentication .
Connection Security	This setting specifies via a drop-down menu one of the following valid connection security: <ul style="list-style-type: none"> • None • STARTTLS • SSL/TTS When connection security is selected, SMTP Port will set a default port number automatically.
SMTP Port	This field is for specifying the SMTP port number. By default, this is set to 25 ; when STARTTLS is selected, the default port number will be set to 587 . When SSL/TTS is selected, the default port number will be set to 465 . You may customize the port number by editing this field.
SMTP User Name / Password	This setting specifies the SMTP username and password while sending email. These options are shown only if Require authentication is checked in the SMTP Server setting.
Confirm SMTP Password	This field allows you to verify and confirm the new administrator password.
Sender's Email Address	This setting specifies the email address the Pepwave router will use to send reports.
Recipient's Email Address	This setting specifies the email address(es) to which the Pepwave router will send email notifications. For multiple recipients, separate each email using the enter key.

After you have finished setting up email notifications, you can click the **Test Email Notification** button to test the settings before saving. After **Test Email Notification** is clicked, you will see this screen to confirm the settings:

Test Email Notification	
SMTP Server	smtp.mycompany.com
SMTP Port	465
SMTP UserName	smtpuser
Sender's Email Address	admin@mycompany.com
Recipient's Email Address	system@mycompany.com staff@mycompany.com

Click **Send Test Notification** to confirm. In a few seconds, you will see a message with detailed test results.

Test email sent.
 (NOTE: Settings are not saved. To confirm the update, click 'Save' button.)

Email Notification Setup ?	
Email Notification	<input checked="" type="checkbox"/> Enable

Event Log

Event log functionality enables event logging at a specified remote syslog server. The settings for configuring the remote system log can be found at **System>Event Log**.

Send Events to Remote Syslog Server ?	
Remote Syslog	<input type="checkbox"/>
Remote Syslog Host	<input type="text"/> Port: <input type="text" value="514"/>

Push Events to Mobile Devices ?	
Push Events	<input checked="" type="checkbox"/>

URL Logging	
Enable	<input checked="" type="checkbox"/>
Log Server Host	<input type="text"/> Port: <input type="text" value="514"/>

Session Logging	
Enable	<input checked="" type="checkbox"/>
Log Server Host	<input type="text"/> Port: <input type="text" value="514"/>

Event Log Settings	
Remote Syslog	This setting specifies whether or not to log events at the specified remote syslog server.
Remote Syslog Host	This setting specifies the IP address or hostname of the remote syslog server and port that is used.
Push Events	The Pepwave router can also send push notifications to mobile devices that have our Mobile Router Utility installed. Check the box to activate this feature. For more information on the Router Utility, go to: www.peplink.com/products/router-utility
URL Logging	This setting is to enable event logging at the specified log server.
URL Logging Host	This setting specifies the IP address or hostname of the URL log server.
Session Logging	This setting is to enable event logging at the specified log server.
Session Logging Host	This setting specifies the IP address or hostname of the Session log server.

SNMP

SNMP or simple network management protocol is an open standard that can be used to collect information about the Pepwave router. SNMP configuration is located at **System>SNMP**.

SNMP Settings	
SNMP Device Name	<input type="text"/>
Location ?	<input type="text"/>
SNMP Port	<input type="text" value="161"/> Default
SNMPv1	<input type="checkbox"/> Enable
SNMPv2c	<input type="checkbox"/> Enable
SNMPv3	<input type="checkbox"/> Enable
SNMP Trap	<input type="checkbox"/> Enable
<input type="button" value="Save"/>	

Community Name	Allowed Source Network	Access Mode
No SNMPv1 / SNMPv2c Communities Defined		
<input type="button" value="Add SNMP Community"/>		

SNMPv3 User Name	Authentication / Privacy	Access Mode
No SNMPv3 Users Defined		
<input type="button" value="Add SNMP User"/>		

SNMP Settings	
SNMP Device Name	This field shows the router name defined at System>Admin Security .
SNMP Port	This option specifies the port which SNMP will use. The default port is 161 .
SNMPv1	This option allows you to enable SNMP version 1.
SNMPv2	This option allows you to enable SNMP version 2.
SNMPv3	This option allows you to enable SNMP version 3.
SNMP Trap	This option allows you to enable SNMP Trap

To add an SNMP community, click the **Add SNMP Community** button in the **Community Name** table; the following screen will be displayed:

SNMP Community ✕

Community Name	<input style="width: 90%;" type="text"/>
Allowed Network	<input style="width: 30%;" type="text"/> / 255.255.255.0 (/24) ▼

SNMP Community Settings

Community Name	This setting specifies the SNMP community name.
Allowed Source Subnet Address	This setting specifies a subnet from which access to the SNMP server is allowed. Enter subnet address here (e.g., 192.168.1.0) and select the appropriate subnet mask.

To define a username for SNMPv3, click **Add SNMP User** in the **SNMPv3 User Name** table, upon which the following screen is displayed:

SNMPv3 User ✕

User Name	<input style="width: 90%;" type="text"/>
Authentication	SHA ▼ <input style="width: 60%;" type="text"/>
Privacy	DES ▼ <input style="width: 60%;" type="text"/>

SNMPv3 User Settings

User Name	This setting specifies a user name to be used in SNMPv3.
Authentication Protocol	<p>This setting specifies via a drop-down menu one of the following valid authentication protocols:</p> <ul style="list-style-type: none"> NONE MD5 SHA <p>When MD5 or SHA is selected, an entry field will appear for the password.</p>
Privacy Protocol	<p>This setting specifies via a drop-down menu one of the following valid privacy protocols:</p> <ul style="list-style-type: none"> None DES AES <p>When AES or DES is selected, an entry field will appear for the password.</p>

InControl

Controller Management Settings	
Controller	? InControl <input type="checkbox"/> Restricted to Status Reporting Only
Privately Host InControl	<input checked="" type="checkbox"/>
InControl Host	<input type="text"/>
	<input type="text"/>
<input type="checkbox"/> Fail over to InControl in the cloud.	
<input type="button" value="Save"/>	

InControl is a cloud-based service which allows you to manage all of your Peplink and Pepwave devices with one unified system. With it, you can generate reports, gather statistics, and configure your devices automatically. All of this is now possible with InControl.

When this checkbox is checked, the device's status information will be sent to the Peplink InControl system. This device's usage data and configuration will be sent to the system if you enable the features in the system.

When the box **Restricted to Status Reporting Only** is ticked, the router will only report its status, but can't be managed or configured by InControl.

Alternatively, you can also privately host InControl. Simply check the box beside the "Privately Host InControl" open, and enter the IP Address of your InControl Host.

You can sign up for an InControl account at <https://incontrol2.peplink.com/>. You can register your devices under the account, monitor their status, see their usage reports, and receive offline notifications.

Configuration

Backing up Pepwave router settings immediately after successful completion of initial setup is strongly recommended. The functionality to download and upload Pepwave router settings is found at **System>Configuration**. Note that the available options vary by model.

Restore Configuration to Factory Settings ?

Download Active Configurations ?

Upload Configurations ?

Configuration File	<input type="button" value="Choose File"/> No file chosen
<input type="button" value="Upload"/>	

Configuration

Restore Configuration to Factory Settings	The Restore Factory Settings button is to reset the configuration to factory default settings. After clicking the button, you will need to click the Apply Changes button on the top right corner to make the settings effective.
Download Active Configurations	Click Download to backup the current active settings.
Upload Configurations	To restore or change settings based on a configuration file, click Choose File to locate the configuration file on the local computer, and then click Upload . The new settings can then be applied by clicking the Apply Changes button on the page header, or you can cancel the procedure by pressing discard on the main page of the web admin interface.

Feature Add-ons

Some Pepwave routers have features that can be activated upon purchase. Once the purchase is complete, you will receive an activation key. Enter the key in the **Activation Key** field, click **Activate**, and then click **Apply Changes**.

Feature Activation

Activation Key	<input style="width: 100%;" type="text"/>
<input type="button" value="Activate"/>	

Reboot

This page provides a reboot button for restarting the system. For maximum reliability, the Pepwave router can equip with two copies of firmware. Each copy can be a different version. You can select the firmware version you would like to reboot the device with. The firmware marked with **(Running)** is the current system boot up firmware.

Please note that a firmware upgrade will always replace the inactive firmware partition.

Reboot System ?

Select the firmware you want to use to start up this device:

Firmware 1: 8.0.1b01 build 2658 (Running)

Firmware 2: 8.0.0 build 2636

Reboot

Tools

Ping

The ping test tool sends pings through a specific Ethernet interface or a SpeedFusion™ VPN connection. You can specify the number of pings in the field **Number of times**, to a maximum number of 10 times. **Packet Size** can be set to a maximum of 1472 bytes. The ping utility is located at **System>Tools>Ping**, illustrated below:

Ping

Connection	WAN 1 ▼
Destination	8.8.8.8
Packet Size	56
Number of times	Times 5 ← → ●

Start
Stop

Results Clear Log

```

PING 8.8.8.8 (8.8.8.8) from 10.22.1.182 56(84) bytes of data.
64 bytes from 8.8.8.8: icmp_req=1 ttl=121 time=11.8 ms
64 bytes from 8.8.8.8: icmp_req=2 ttl=121 time=11.7 ms
64 bytes from 8.8.8.8: icmp_req=3 ttl=121 time=11.6 ms
64 bytes from 8.8.8.8: icmp_req=4 ttl=121 time=11.6 ms
64 bytes from 8.8.8.8: icmp_req=5 ttl=121 time=11.4 ms

--- 8.8.8.8 ping statistics ---
5 packets transmitted, 5 received, 0% packet loss, time 4006ms
rtt min/avg/max/mdev = 11.427/11.680/11.888/0.166 ms
          
```

Tip

A system administrator can use the ping utility to manually check the connectivity of a particular LAN/WAN connection.

Traceroute Test

The traceroute test tool traces the routing path to the destination through a particular Ethernet interface. The traceroute test utility is located at **System>Tools>Traceroute**.

Traceroute

Connection	WAN 1
Destination	64.233.189.99

Results

```

Traceroute to 64.233.189.99 (64.233.189.99), 30 hops max, 60 byte packets

```

Tip

A system administrator can use the traceroute utility to analyze the connection path of a LAN/WAN connection.

Wake-on-LAN

Peplink routers can send special “magic packets” to any client specified from the Web UI. To access this feature, navigate to **System > Tools > Wake-on-LAN**.

Select a client from the drop-down list and click **Send** to send a “magic packet”

WAN Analysis

The WAN Analysis feature allows you to run a WAN to WAN speed test between 2 Peplink devices . You can set a device up as a **Server** or a **Client**. One device must be set up as a server to run the speed tests and the server must have a public IP address.

The default port is 6000 and can be changed if required. The IP address of the WAN interface will be shown in the **WAN Connection Status** section.

The Speedfusion status page shows all related information about the PepVPN connection.

This screen also allows you to run PepVPN Tests allowing throughput tests.

Peplink also published a whitepaper about Speedfusion which can be downloaded from the following url:

<http://download.peplink.com/resources/whitepaper-speedfusion-and-best-practices-2019.pdf>

Event Log

Event log information is located at **Status>Event Log**

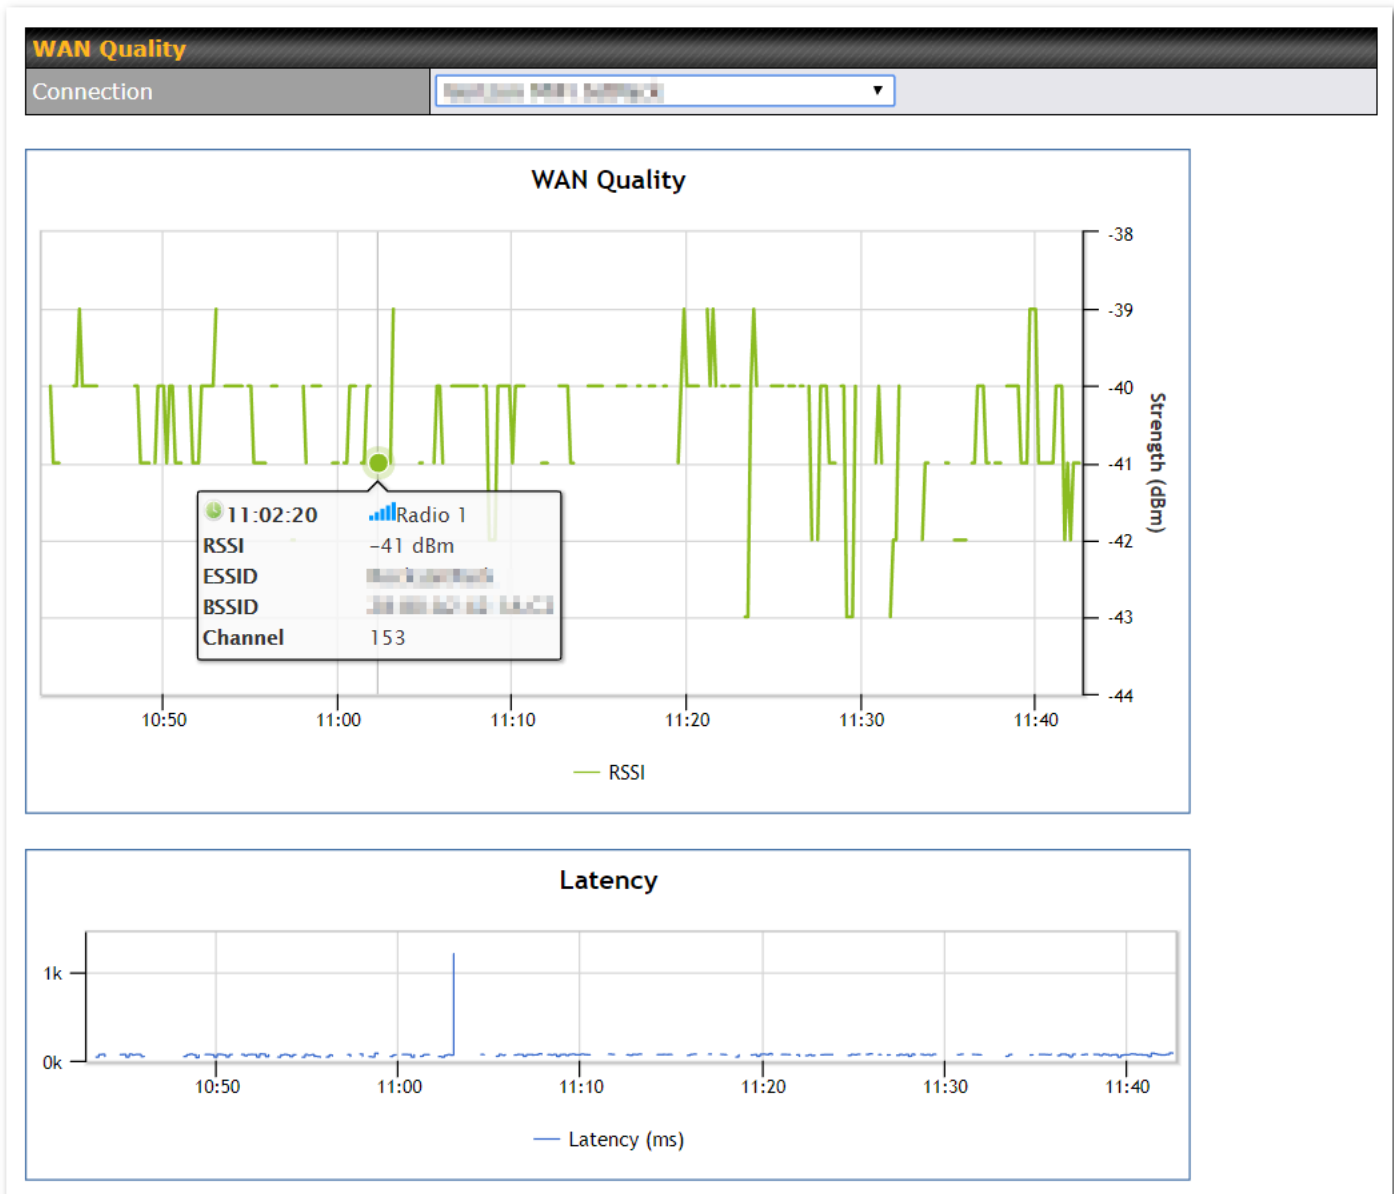

The screenshot displays the PEPWAVE web interface. The top navigation bar includes 'Dashboard', 'SpeedFusion Cloud', 'Network', 'Advanced', 'AP', 'System', and 'Status' (which is highlighted). Below the navigation bar is a sidebar menu with sections: 'Status' (containing Device, Active Sessions, Client List, OSPF & RIPv2, BGP, and Event Log), 'WAN Quality', and 'Usage Reports' (containing Real-Time, Hourly, Daily, and Monthly). A 'Logout' button is located at the bottom of the sidebar. The main content area shows the 'Device Event Log' section, which includes a 'Firewall Event Log' tab, a table of events, an 'Auto Refresh' checkbox (checked), and a 'Clear Log' button.

The log section displays a list of events that has taken place on the Pepwave router. Check **Auto Refresh** to refresh log entries automatically. Click the **Clear Log** button to clear the log.

WAN Quality

WAN Quality allows you to select each WAN and view current WAN Quality. Detailed information can be seen when selecting a point on the graph.

Usage Reports

This section shows bandwidth usage statistics and is located at **Status>Bandwidth**. Bandwidth usage at the LAN while the device is switched off (e.g., LAN bypass) is neither recorded nor shown.

Real Time

The **Data transferred since installation** table indicates how much network traffic has been processed by the device since the first bootup. The **Data transferred since last reboot** table indicates how much network traffic has been processed by the device since the last boot up.

Data transferred since installation Fri Mar 22 14:38:07 MST 2019

	Download	Upload	Total
All WAN Connections	1.17 TB	3.53 TB	4.70 TB

Data transferred since last reboot

	Download	Upload	Total
All WAN Connections	23.26 GB	156.88 GB	180.14 GB

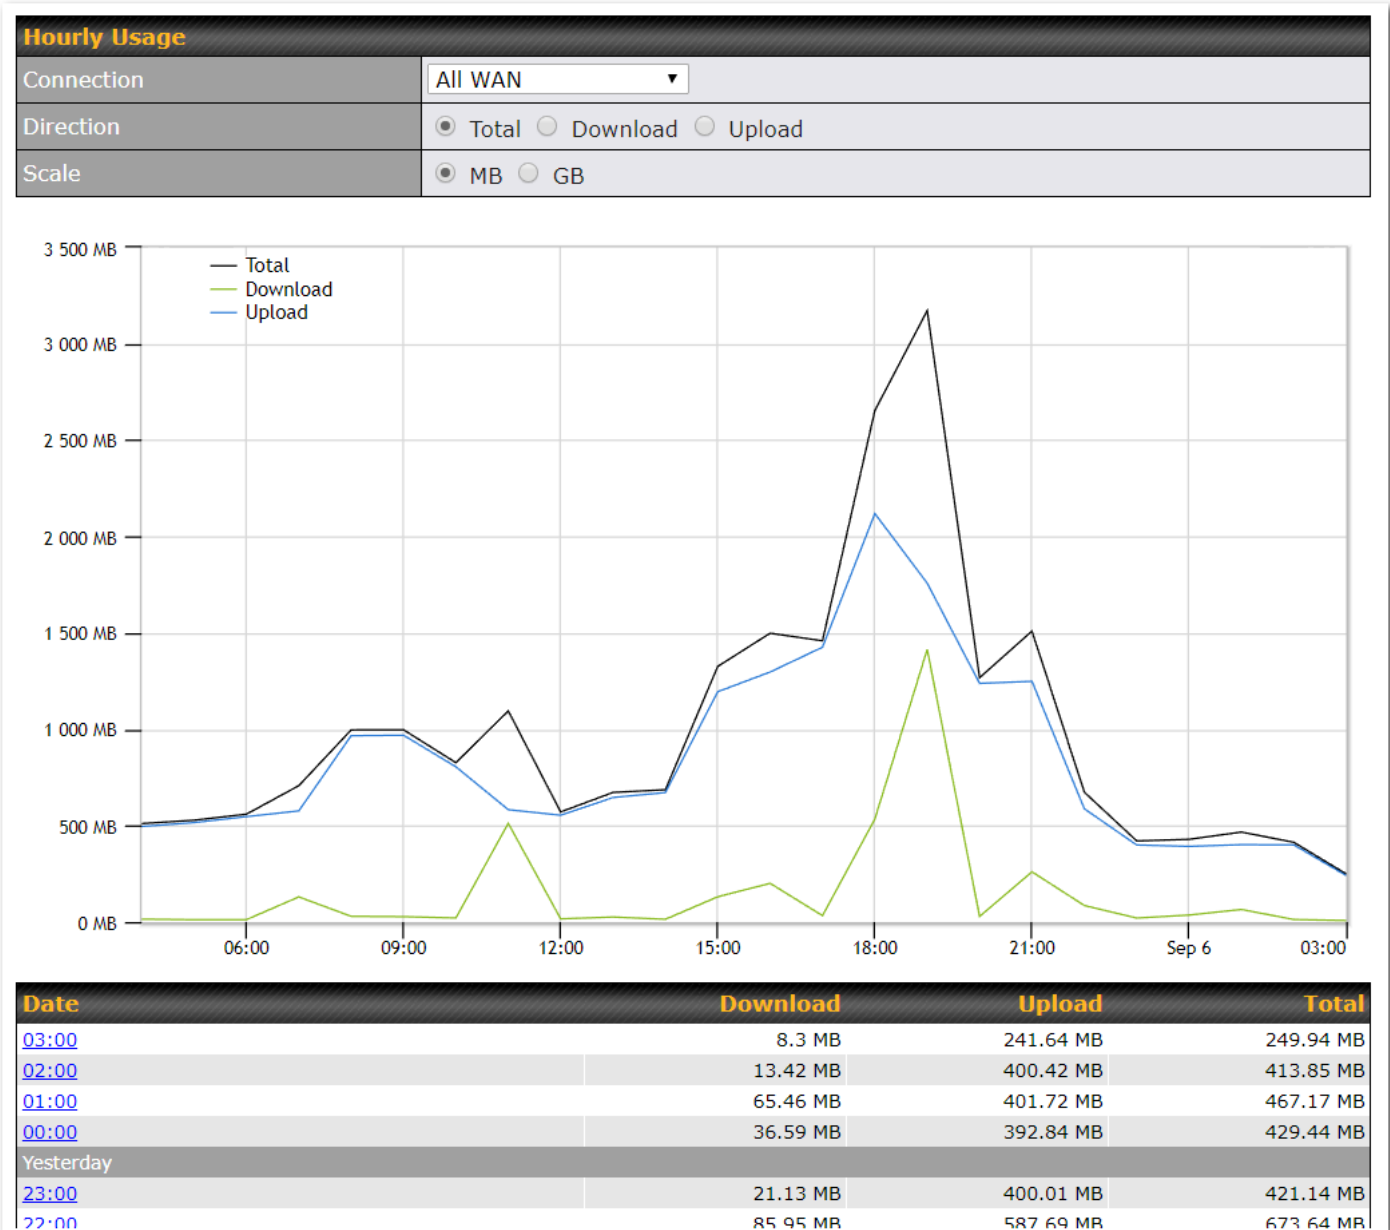

Avg: ↓ 25.6 kbps ↑ 1.10 Mbps Peak: ↓ 122.0 kbps ↑ 5.30 Mbps

	Download	Upload	Total
Overall	28.0 kbps	13.0 kbps	41.0 kbps

Hourly

This page shows the hourly bandwidth usage for all WAN connections, with the option of viewing each individual connection. Select the desired connection to check from the drop-down menu.

Daily

This page shows the daily bandwidth usage for all WAN connections, with the option of viewing each individual connection.

Select the connection to check from the drop-down menu. If you have enabled the **Bandwidth Monitoring** feature, the **Current Billing Cycle** table for that WAN connection will be displayed.

Click on a date to view the client bandwidth usage of that specific date. This feature is not available if you have selected to view the bandwidth usage of only a particular WAN connection. The scale of the graph can be set to display megabytes (MB) or gigabytes (GB).

Monthly

This page shows the monthly bandwidth usage for each WAN connection. If you have enabled the **Bandwidth Monitoring** feature, you can check the usage of each particular connection and view the information by **Billing Cycle** or by **Calendar Month**.

Click the first two rows to view the client bandwidth usage in the last two months. This feature is not available if you have chosen to view the bandwidth of an individual WAN connection. The scale of the graph can be set to display megabytes (**MB**) or gigabytes (**GB**).

Monthly Usage

Appendix A: Restoration of Factory Defaults

To restore the factory default settings on your Pepwave Surf SOHO unit, follow the steps below:

1. Locate the reset button on the back panel of the Pepwave Surf SOHO.
2. With a paperclip, press and keep the reset button pressed.

Note: There is a dual function to the reset button.

Hold for 5-10 seconds for admin password reset (Note: The LED status light blinks in RED 2 times and release the button, green status light starts blinking)

Hold for approximately 20 seconds for factory reset (Note: The LED status light blinks in RED 3 times and release the button, all WAN/LAN port lights start blinking)

After the Pepwave Surf SOHO finishes rebooting, the factory default settings will be restored.

Important Note

All previous configurations and bandwidth usage data will be lost after restoring factory default settings. Regular backup of configuration settings is strongly recommended.

Appendix B: Overview of ports used by Peplink SD-WAN routers and other Peplink services

Default Port Number	Usage	Service	Inbound/Outbound	Default Status
UDP 5246	Data flow	InControl	Outbound	Enabled
TCP 443	HTTPS service	InControl	Outbound	Enabled
TCP 5246	Optional, used when TCP 443 is not responding	InControl	Outbound	Enabled
TCP 5246	Remote Web Admin	InControl Virtual Appliance	Outbound	Enabled
TCP 4500	VPN Data (TCP Mode)	PepVPN / SpeedFusion	Inbound / Outbound*	Disabled
TCP 32015	VPN handshake	PepVPN / SpeedFusion	Inbound / Outbound*	Disabled
UDP 4500	VPN Data	PepVPN / SpeedFusion	Inbound / Outbound*	Disabled
UDP 32015 ^o	VPN Data (alternative)	PepVPN / SpeedFusion	Inbound / Outbound*	Disabled
TCP/UDP 4500+N-1 [^]	VPN Sub-Tunnels Data	PepVPN / SpeedFusion	Inbound / Outbound*	Disabled
UDP 32015+N-1 [^]	VPN Sub-Tunnels Data (alternative)	PepVPN / SpeedFusion	Inbound / Outbound*	Disabled
UDP 4500	VPN Data	IPsec	Inbound / Outbound*	Disabled
UDP 500	VPN initiation	IPsec	Inbound / Outbound*	Disabled
UDP 500	L2TP	Remote User Access	Inbound	Disabled
UDP 1701	L2TP	Remote User Access	Inbound	Disabled
UDP 4500	L2TP	Remote User Access	Inbound	Disabled
UDP 1194	OpenVPN	Remote User Access	Inbound	Disabled
IP 47	PPTP (GRE)	Remote User Access	Inbound	Disabled
TCP 2222	Remote Assistance Direct connection	Peplink Troubleshooting Assistance	Outbound	Enabled
TCP 80	HTTP traffic	Web Admin Interface access	Inbound	Enabled
TCP 443	HTTPS traffic	Web Admin Interface access (secure)	Inbound	Enabled
TCP 8822	SSH	SSH	Inbound	Disabled
UDP 161	SNMP Get	SNMP monitoring	Inbound	Disabled
UDP 162	SNMP Trap	SNMP monitoring	Outbound	Disabled
TCP, UDP 1812	Radius Authentication	Radius	Outbound	Disabled
TCP, UDP 1813	Radius Accounting	Radius	Outbound	Disabled
UDP 123	Network Time Protocol	NTP	Inbound Outbound	Disabled Enabled
TCP 60660	Real-time location data in NMEA format	GPS	Outbound	Disabled

Disclaimer:

- By default, only TCP 32015 and UDP 4500 are needed for PepVPN / SpeedFusion.
- Inbound / Outbound* - Inbound = For Server mode; Outbound = For Client mode
- UDP 32015° - If IPsec VPN or L2TP/IPsec RUA is enabled, the UDP 4500 is occupied, so PepVPN / SpeedFusion will automatically switch to UPD 32015 as VPN data port .
- UDP 32015+N-1^ / TCP/UDP 4500+N-1^ - When using Sub-Tunnels, multiple ports are in use (1 for each Sub-Tunnel profile).

The default UDP data ports used when using (N number of Sub-Tunnel profiles) are: 4500...4500+N-1, or (when port 4500 is in use by IPsec or L2TP/IPsec) 32015... 32015+N-1".

Appendix C: Declaration

- **The device supports time division technology**
- **Federal Communication Commission Interference Statement**

This device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions: (1) This device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio/TV technician for help.

Any changes or modifications not expressly approved by the party responsible for compliance could void the user's authority to operate this equipment.

Operations in the 5.15-5.25GHz band are restricted to indoor usage only.

Radiation Exposure Statement

This equipment complies with FCC RF radiation exposure limits set forth for an uncontrolled environment. This equipment should be installed and operated with a minimum distance of 20 cm between the radiator and your body.

The availability of some specific channels and/or operational frequency bands are country dependent and are firmware programmed at the factory to match the intended destination.

CE Statement for Pepwave Routers (Surf SOHO)

DECLARATION OF CONFORMITY

We affirm the electrical equipment manufactured by us fulfils the requirements of the Radio Equipment Directive 2014/53/EU or R&TTE Directive 1999/5/EC

Name of manufacturer	PISMO LABS TECHNOLOGY LIMITED
Contact information of the manufacturer	A8, 5/F, HK Spinners Industrial. Building., Phase 6, 481 Castle Peak Road, Cheung Sha Wan, Kowloon, Hong Kong tel. (852) 2990 7600, fax. (852) 3007 0588 e-mail: cs@peplink.com
Description of the appliance	Pepwave / Peplink / Pismo Labs Wireless Product
Model name of the appliance	Surf SOHO
Trade name of the appliance	Pepwave / Peplink / Pismo

The construction of the appliance is in accordance with the following standards:

EN 301 893 V1.8.1
EN 300 328 V1.9.1
EN 62311:2008
EN 301 489-1 V1.9.2
EN 301 489-17 V2.2.1
EN 55032: 2012 + AC:2013
EN 55024:2010+A1:2015
EN 61000-3-2: 2014
EN 61000-3-3: 2013
EN 60950-1:2006+A11:2009+A1:2010+A12:2011+A2:2013

Yours sincerely,

Antony Chong
Director of Hardware Engineering
Peplink International Limited
